## 1.1 Title Bar

### Title Bar

The title bar is located along the top of a window. It contains the name of the application and drawing.

To move the window, drag the title bar. Note: You can also move dialog boxes by dragging their title bars.

A title bar may contain the following elements:

- Application Control-menu button

- Drawing Control-menu button
- Maximize button
- Minimize button
- Name of the application
- Name of the drawing
- Restore button

## 1.2 Scroll Bars

### Scroll bars

Displayed at the right and bottom edges of the drawing window. The scroll boxes inside the scroll bars indicate your vertical and horizontal location in the drawing. You can use the mouse to scroll to other parts of the drawing.

## 1.3 Size (system) command

### Size command (System menu)

Use this command to display a four-headed arrow so you can size the active window with the arrow keys.

After the pointer changes to the four-headed arrow:

1. Press one of the DIRECTION keys (left, right, up, or down arrow key) to move the pointer to the border you want to move.
2. Press a DIRECTION key to move the border.
3. Press ENTER when the window is the size you want.

Note: This command is unavailable if you maximize the window.

### Shortcut

Mouse: Drag the size bars at the corners or edges of the window.

## 1.4 Minimize (system) command

### Minimize command (application Control menu)

Use this command to reduce the Orca window to an icon.

### Shortcut

Mouse: Click the minimize icon  on the title bar.  
Keys: ALT+F9

## 1.5 Maximize (system) command

### Maximize command (System menu)

Use this command to enlarge the active window to fill the available space.

#### Shortcut

- Mouse: Click the maximize icon  on the title bar; or double-click the title bar.  
Keys: CTRL+F10 enlarges a drawing window.

## 1.6 Move (system) command

### Move command (Control menu)

Use this command to display a four-headed arrow so you can move the active window or dialog box with the arrow keys.

Note: This command is unavailable if you maximize the window.

#### Shortcut

- Keys: CTRL+F7

## 1.7 Restore (system) command

### Restore command (Control menu)

Use this command to return the active window to its size and position before you chose the Maximize or Minimize command.

## 1.8 Close (system) command

### Close command (Control menus)

Use this command to close the active window or dialog box.

Double-clicking a Control-menu box is the same as choosing the Close command.

#### Shortcuts

- Keys: CTRL+F4 closes a drawing window  
ALT+F4 closes the application

## 1.9 Previous Window (system) command

### Previous Window command (drawing Control menu)

Use this command to switch to the previous open drawing window. Orca determines which window is previous according to the order in which you opened the windows.

#### Shortcut

Keys: SHIFT+CTRL+F6

## 1.10 Next Window (system) command

### Next Window command (drawing Control menu)

Use this command to switch to the next open drawing window. Orca determines which window is next according to the order in which you opened the windows.

#### Shortcut

Keys: CTRL+F6

## 1.11 Switch to (system) command

### Switch to command (application Control menu)

Use this command to display a list of all open applications. Use this "Task List" to switch to or close an application on the list.

#### Shortcut

Keys: CTRL+ESC

#### Dialog Box Options

When you choose the Switch To command, you will be presented with a dialog box with the following options:

##### Task List

Select the application you want to switch to or close.

##### Switch To

Makes the selected application active.

##### End Task

Closes the selected application.

##### Cancel

Closes the Task List box.

##### Cascade

Arranges open applications so they overlap and you can see each title bar. This option does not affect applications reduced to icons.

**Tile**

Arranges open applications into windows that do not overlap. This option does not affect applications reduced to icons.

**Arrange Icons**

Arranges the icons of all minimized applications across the bottom of the screen.

**1.12 An Introduction To CQuat Fractals****An Introduction To CQuat Fractals By Terry W. Gintz**

In the process of exploring all possible extensions to a fractal generator of this type, I considered using discrete modifications of the standard quaternion algebra to discover new and exciting images. The author of *Fractal Ecstasy* [6] produced variations of the Mandelbrot set by altering the discrete complex algebra of  $z^2+c$ . The extension of this to quad algebra was intriguing. There was also the possibility of different forms of quad algebra besides quaternion or hypercomplex types.

Having modeled 3D fractals with complexified octonion algebra, as described in Charles Muses' non-distributive algebra [7], it was natural to speculate on what shapes a "complexified" quaternion algebra would produce. Would it be something that was between the images produced with hypercomplex and quaternion algebra? Quaternion shapes tend to be composed of mainly rounded lines, and hypercomplex shapes are mainly square (see Figures 1 and 2.)

Figure 1. Quaternion Julia set of  $-1+0i$

Figure 2. Hypercomplex Julia set of  $-1+0i$

For those not familiar with the basics of hypercomplex and quaternion algebra, here are the algebraic rules that define how complex components interact with each other:

$$i \quad j \quad k$$

$i$	$-1$	$k$	$-j$
$j$	$k$	$-1$	$-i$
$k$	$-j$	$-i$	$1$

**Table 1** Hypercomplex variable multiplication rules

	$i$	$j$	$k$
$i$	$-1$	$k$	$-j$
$j$	$-k$	$-1$	$i$
$k$	$j$	$-i$	$-1$

**Table 2** Quaternion variable multiplication rules

In both quaternion and hypercomplex algebra,  $i^2 = -1$ . The hypercomplex rules provide for one real variable, two complex variables, ( $i$  and  $j$ ) and one variable that Charles Muses refers to as countercomplex ( $k$ ), since  $k*k = 1$ . It would appear from this that  $k = 1$ , but the rules in Table 1 show that  $k$  has complex characteristics. In quaternion algebra there is one real variable and three complex variables. In hypercomplex algebra, unlike quaternion algebra, the commutative law holds; that is, reversing the order of multiplication doesn't change the product. The basics of quaternion and hypercomplex algebra are covered in Appendix B of *Fractal Creations* [8]. One other concept important to non-distributive algebra is the idea of a "ring". There is one ring in quaternion and hypercomplex algebra ( $i, j, k$ ). (There are seven rings in octonion algebra.) If you start anywhere in this ring and proceed to multiply three variables in a loop, backwards or forwards, you get the same number, 1 for hypercomplex, and 1 or -1 for quaternion, depending on the direction you follow on the ring. The latter emphasizes the non-commutative nature of quaternions. E.g. : using quaternion rules,  $i*j*k = k*k = -1$ , but  $k*j*i = -i*i = 1$ .

For "complexified" quaternion algebra, the following rules were conceived:

	$i$	$j$	$k$
$i$	$-1$	$-k$	$-j$
$j$	$-k$	$1$	$i$
$k$	$-j$	$i$	$1$

**Table 3** CQuat variable multiplication rules

Note that there are two countercomplex variables here, ( $j$  and  $k$ ). The commutative law holds

like in hypercomplex algebra, and the "ring" equals -1 in either direction. Multiplying two identical quad numbers together,  $(x+yi+zj+wk)(x+yi+zj+wk)$  according to the rules of the complexified multiplication table, combining terms and adding the complex constant, the following iterative formula was derived for the "complexified" quaternion set,  $q^2+c$ :

$$\begin{aligned}x &\rightarrow x*x - y*y + z*z + w*w + cx \\y &\rightarrow 2.0*x*y + 2.0*w*z + cy \\z &\rightarrow 2.0*x*z - 2.0*w*y + cz \\w &\rightarrow 2.0*x*w - 2.0*y*z + cw\end{aligned}$$

Just to get a feel for this new formula, a fairly basic constant,  $-1+0i$ , was used for the initial 3D test. The extraordinary picture "Equilibrium"(Figure 3) was the result.

Figure 3. Equilibrium -- cquat Julia rendering of  $-1+0i$

Being familiar with the quaternion and hypercomplex renditions of the Julia set  $-1+0i$ , it appeared that this image was a leap into hyperspace; the fractal seemed to literally expand in all directions at once. The next test used a Siegel disk constant,  $-.39054-.58679i$ , which Roger Bagula [9] had recently sent. The Siegel image (Figure 4) strongly suggested that cquats were indeed a new form of space-filling fractal.

Figure 4 Siegel -- cquat Julia rendering of  $-.39054-.58679i$

Since then, Godwin Vickers has ported the cquat formula to the *Persistence of Vision Ray-tracer* [10], and verified that the equilibrium image wasn't just an artifact of Orca. Nearly identical images have been obtained in POV, using Pascal Massimino's [11] custom formula algorithm for 3D Mandelbrot and Julia sets.

There remains the extension of cquat algebra to transcendental and exponential functions.

Any ideas for this are welcome. The built-in formulas in Orca have been revised to include quat variations where possible.

## 1.13 Tutorial On Juliat Fractals

It is easy to speculate on what a true 3D representation of a 2D Julia set based on the complex constant  $-1+0i$  would look like, but thus far no quad math has produced the figure you might expect.

The 2-D version of this set is:

So given all the knobbies in this fractal, you would expect to see the same in a 3-D version.

Alas, using quaternion math for the formula  $z=z-1$ , you get:

which blurs all the knobies like a lathe-like turning.

Using hypercomplex math (hypernion type fractal), you get:

which again blurs all the knobies, this time in a squared-off way.

My experiment with complexified quaternion math (cquat) produces:

which interestingly enough retains some of the knobs and adds a lot of links that aren't in the original 2-D fractal.

Fortunately, there are other quad maths that can be explored for their fractal producing characteristics.

Using the random quad generator in Hydra, I discovered a quad matrix that seems to be the closest approximation to what is needed to generate true 3-D Julia sets.

Since the matrix was found visually instead of logically, the image is shown first:

The squaring matrix for this fractal looks like:

$$\begin{array}{cccc}
 & i & j & k \\
 i & -1 & k & j \\
 j & k & -1 & i \\
 k & j & i & -1
 \end{array}$$

and the derived iterative formula (for  $z^2+c$ ) is:

$$\begin{array}{l}
 x \rightarrow x*x - y*y - z*z - w*w + cx \\
 y \rightarrow 2.0*x*y + 2.0*w*z + cy \\
 z \rightarrow 2.0*x*z + 2.0*w*y + cz \\
 w \rightarrow 2.0*x*w + 2.0*y*z + cw
 \end{array}$$

Considering that in the 2-D world the iterative formula for  $z^2+c$  is:

$$\begin{array}{l}
 x \rightarrow x*x - y*y + cx \\
 y \rightarrow 2.0*x*y + cy
 \end{array}$$

it seems that this quad math (which I have named Juliat) hits the target right on the button!

How strange that no algebraic rules have been established for this matrix, nor is it discussed as a possible math for rendering 3-D fractals.

Note: these figures were all drawn using forty iterations, which gives a rather coarse 3-D surface, but is necessary to fully reveal the shape of the Juliat fractal. With 2-D fractals, the

formulas are typically iterated 150 times or more. At fewer than 20 iterations, Julia fractals appear to have dabs of paint spread across the figure.

## 2 Orca Remote

### Orca Remote

The remote provides access to many of the most-used commands in Orca. Info about each button can be obtained by using the "?" located near the close box in the top right-hand corner of the remote.

### 2.1 Channel Guide

#### Channel Guide

The four Demo channels accessed via the Orca remote:

3-D Julia: Random 3-D Julia set fractals

2-D Julia: Random 2-D Julia set fractals

Stalks: Random Orbit-trap Julia set fractals

Bubbles: Random Bubble-style Julia set fractals

### 2.2 New button

#### New button

Use this button to open a new drawing window in Orca. This is useful to view minor changes to a drawing. Use the Copy Data and Paste Data commands from the Edit menu to transfer current drawing parameters to the new window.

### 2.3 Undo button

#### Undo button

Use this command to undo the last action. An image cannot be continued after an undo.

### 2.4 Size button

#### Size button

This allows you to set the drawing area for a picture, independent of the Windows screen size. It also shows which size is currently in use. The aspect for the drawing is based on the ratio of X (horizontal width) to Y (vertical height.) The size of an image can range in standard 4/3 and 1/1 aspects from 160X120 to 3600X2700 or you can choose a custom XY size. The custom setting allows for any size/aspect that system memory will permit. The minimum

size for an image is 40X30. Note: Solid-guessing mode is disabled if the drawing aspect is other than 4/3 or 1/1. If the image is less than 100 width, the aspect must be 4/3 for solid guessing to work properly.

## 2.5 Draw button

### Draw button

Use this button to draw or redraw the image for the current fractal variables. Clicking inside the draw window with the left-mouse button stops all plotting. Use the Continue toolbar button to restart plotting from the current column.

## 2.6 Batch button

### Batch button

Here you set parameters for batching and saving random-generated images to disk. You can also customize random variables to direct how the random scanning process works.

## 2.7 Text button

### Text button

Edit 3-D texture-scaling variable.

## 2.8 Abort button

### Abort button

Use this command to stop drawing. Clicking inside a window's drawing area or close box (or the program close box) will also stop the drawing. Note: once a plot has started Orca continues to draw the image for that window regardless of which drawing window has the input focus, until done or aborted. You can open and close other drawing windows without affecting the current drawing, but only one drawing is active at any time.

## 2.9 View button

### View button

Displays the entire plot, expanding or shrinking the image to fit in a maximized window without title bar, scroll bars or menu bar. At all other times, part of the picture is hidden by the inclusion of the title bar, toolbar, scroll bars and menu bar. To exit full-screen mode, press any key or click the left-mouse button.

## 2.10 Scan button

### Scan button

This generates a 3-D or 2-D Julia set from a formula's Mandelbrot 'P' space. Random points in a formula's current Mandelbrot space are scanned for an interesting Julia set. Rendering options are maintained in the current fractal. Equivalent to the ['F' hot key](#).

## 2.11 Rend button

### Rend button

The current lighting variables are applied. This allows you to see what the surface texture looks like while the fractal is drawing.

## 2.12 Help button

### Help button

Use this button to open the help index for Orca.

## 2.13 Palette button

### Palette button

Use the [palette editor](#) to modify the color palette in use.

## 2.14 Light button

### Light button

Edit [lightpoint and viewpoint](#) variables

## 2.15 Formula button

### Formula button

Use this button to change [formula](#).

## 2.16 Params button

### Params button

Use this button to edit [Fractal Parameters](#).

## 2.17 3-D Julia button

### 3-D Julia button

A random 3-D fractal is generated. The built-in formulas are scanned to find an interesting Julia set, and then the parameters are adjusted to produce a 3-D image. The ranges are reset, H<sub>j</sub> is set to 2.0, and the lighting is set for optimum viewing (if lighting is checked in the [Random Batch](#) window.)

Note: for some images an Hj value of 2.0 may result in a partially clipped image. Sometimes it helps to increase this value to 2.5 or 3.0, but too high a value may interfere with solid guessing.

## 2.18 2-D Julia

### 2-D Julia button

A random Julia fractal is generated. Many of the built-in options of Orca are selected on a random basis (if enabled in the Random Setup window), and the Mandelbrot space for one of the twenty-two built-in formulas is scanned for an interesting Julia set. The palette used is also randomized (if Random coloring is selected.). Note: In most cases the Julia search is a short one, but sometimes the "seek" mode can seem to get stuck when the criteria for an interesting Julia set fails to match the formula used. In the latter case, click the left mouse button to restart the search process. Tip: some things remain to be done after the Julia set is drawn. Feel free to experiment with all the parameters, reframe the image, change palettes etc. This routine provides a fast intro to many options in Orca that the user may be unfamiliar with: no knowledge of fractal science/math required! See the [hot keys](#) section also for a description of the 'F' command.

## 2.19 Stalks

### Stalks button

A random Julia fractal is generated using one of Paul Carlson's orbit trap methods.

## 2.20 Bubbles

### Bubbles button

A random Julia fractal is generated using Paul Carlson's bubble method.

## 2.21 Random Render button

### Random Render button

The rendering styles of the current drawing are randomized, according to the options selected in the [Random Setup](#) window.

## 2.22 Save button

### Save button

Use this button to save and name the active drawing. Orca displays the [Save As dialog box](#) so you can name your drawing. To save a drawing with its existing name and directory, use the

File/Save command.

## 2.23 Load button

### Load button

Use this button to open an existing data/image file in a new window. Use the Window menu to switch among the multiple open images.

## 2.24 Bmp button

### BMP button

Use this button to select the BMP format when loading and saving fractals. This is the default Windows bitmap format, readable by most Windows programs that use image files. This is also the fastest method of loading and saving fractals, but requires more disk space, since no compression is used. Windows keeps track of the last six BMP files saved or loaded (displayed in the Files menu.)

## 2.25 Png radio button

### PNG radio button

Use this button to select the PNG format when loading and saving fractals. This format uses medium compression without loss of image quality.

## 2.26 Jpg radio button

### JPG radio button

Use this button to select the JPEG format when loading and saving fractals. This format uses moderate compression but with some loss of image quality. This is preferable for posting to the net, since most browsers can display jpeg files.

## 2.27 ||||| button

### Write Avi button

Through a series of windows, this allows you to name and open an avi animation stream and choose a compression method. After using the file requester to name the file, you are given a choice of compression methods. The compression methods include Intel Indeo Video®, Microsoft Video 1 and Cinepak Codec by Radius. (All compression methods degrade the original images, some more than others.) The frames in the frame buffer are then written to the avi stream and the stream closed.

## 2.28 > button

### Add Key Frame button

Orca uses a frame buffer to compose an animation. You add key frames to the buffer with this command. Each key frame is identical to the active image. Change variables between key frames to create the illusion of motion or morphing. You can edit the frames with the [frame editor](#).

## 2.29 [] button

### [ ] button

Opens the frame editor window so you can edit frames in the video buffer by using any of the other editor windows. The Move button allows you to move a frame from one spot in the buffer to another. You can change the frame image being edited by using the Frame slider or Edit box. After changing frames, use the Preview button to display the current frame being edited. The Delete button allows you to delete all but two of the frames, the minimum number of frames to create a movie. (If you want to delete all the frames, use the [Video/Reset Frames](#) command.)

## 2.30 V button

### V button

Opens an avi file for viewing. You can preview any multimedia file by clicking on its file name. A multimedia box will appear to the right of the file list. Click on okay to open the main view window.

There are buttons to Play a file forwards or Backwards, or forward automatically with Auto rewind/repeat. Click on Slow to slow down a video. Each click on Slow halves the viewing speed. A click on Stop freezes viewing and restores the view speed to normal playback.

Use the Open button to view a different avi file. Use the Save button to save the file in a different compression format. You must use a different name to save the file than the name that was used to open it. Click on the left-mouse button or any key to abort a save operation.

Note: the view avi requester can be used to preview any multimedia file, including midi files.

## 3 File Menu

### File menu commands

The File menu offers the following commands:

<a href="#">New</a>	Creates a new drawing.
<a href="#">Open</a>	Opens an existing drawing.
<a href="#">Close</a>	Closes an opened drawing.
<a href="#">Save</a>	Saves an opened drawing using the same file name.

<a href="#">Save As</a>	Saves an opened drawing to a specified file name.
<a href="#">Load Parameters</a>	Load parameters from an existing drawing.
<a href="#">Load Palette [PQZ]</a>	Load palette file.
<a href="#">Load Texture</a>	Load Orca texture file [QTX]
<a href="#">Open [JPG]</a>	Load jpeg.
<a href="#">Open [PNG]</a>	Load png.
<a href="#">Load Text Data [ORT]</a>	Load text (platform-independent) data file.
<a href="#">Save Parameters</a>	Save parameters for an opened drawing to a specified file name.
<a href="#">Save Palette [PQZ]</a>	Save palette to file.
<a href="#">Save Texture</a>	Save texture file [QTX].
<a href="#">Save As [JPG]</a>	Save in jpeg format.
<a href="#">Save As [PNG]</a>	Save in png format.
<a href="#">Save Text Data [ORT]</a>	Save data in text (platform-independent) format.
<b>Import Options</b>	
<a href="#">Palette [MAP]</a>	Load a Fractint map file.
<b>Export Options</b>	
<a href="#">Save as [OBJ]</a>	Save polygonized 3-D fractal as Wavefront object.
<a href="#">Simplify</a>	Simplify mesh.
<a href="#">Save as [POV]</a>	Save polygonized 3-D fractal as a pov triangle object.
<a href="#">Smooth</a>	Convert triangle mesh to smooth_triangle mesh.
<a href="#">Set Max Faces</a>	Set target face size for mesh-simplification option.
<a href="#">Save As [STL]</a>	Save polygonized 3-D fractal as STL solid file.
<a href="#">Save as [WRL]</a>	Save polygonized 3-D fractal as virtual reality file.
<a href="#">Save as [DXF]</a>	Save polygonized 3-D fractal as AutoCad dxf file.
<a href="#">Save as [PLY]</a>	Save polygonized 3-D fractal as Ply file.
<a href="#">Set Max Indices</a>	Set maximum number of vertices allocated for Q polygon.
<a href="#">Exit</a>	Exits Orca.

### 3.1 New command

#### New command (File menu)

Use this command to create a new drawing window in Orca. The image and data for the opening picture are used to create the new window.

You can open an existing data/image file with the [Open command](#).

#### Shortcuts

Keys: CTRL+N

### 3.2 Open command

#### Open command (File menu)

Use this command to open an existing data/image file in a new window. Use the Window menu to switch among the multiple open images. See [Window 1, 2, ... command](#).

You can create new images with the [New command](#).

### Shortcuts

Toolbar:   
Keys: CTRL+O

## 3.2.1 File Open dialog box

### File Open dialog box

The following options allow you to specify which file to open:

#### File Name

Type or select the filename you want to open. This box lists files with the extension you select in the List Files of Type box.

#### List Files of Type

Select the type of file you want to open.

#### Drives

Select the drive in which Orca stores the file that you want to open.

#### Directories

Select the directory in which Orca stores the file that you want to open.

#### Network...

Choose this button to connect to a network location, assigning it a new drive letter.

## 3.3 Close command

### Close command (File menu)

Use this command to close the window containing the active image. If you close a window without saving, you lose all changes made since the last time you saved it.

You can also close a drawing by using the Close icon on the drawing window, as shown below:

## 3.4 Save command

### Save command (File menu)

Use this command to save the active drawing to its current name and directory. When you save a drawing for the first time, Orca displays the [Save As dialog box](#) so you can name your drawing. If you want to change the name and directory of an existing drawing before you save it, choose the [Save As command](#).

## Shortcuts

Toolbar:   
Keys: CTRL+S

## 3.5 Save As command

### Save As command (File menu)

Use this command to save and name the active drawing. Orca displays the [Save As dialog box](#) so you can name your drawing.

To save a drawing with its existing name and directory, use the [Save command](#).

### 3.5.1 Save As dialog box

#### File Save As dialog box

The following options allow you to specify the name and location of the file you're about to save:

#### File Name

Type a new filename to save a drawing with a different name. Orca adds the extension .orc to the data file.

#### Drives

Select the drive in which you want to store the drawing.

#### Directories

Select the directory in which you want to store the drawing.

#### Network...

Choose this button to connect to a network location, assigning it a new drive letter.

## 3.6 Load Other

### 3.6.1 Parameters command

#### Load Parameters command (File menu)

Use this command to load a data file [.orc]. The data file contains all variables to recreate an image created previously with Orca.

### 3.6.2 Palette command

#### Load Palette command (File menu)

Use this command to load a palette file [.pqz]. The palette file contains a palette created previously with Orca. You also have the option in the file descriptor box to select palette and coloring filter, to reload both palette and the coloring filter that was saved along with it.

### 3.6.3 Texture command

#### Load Texture command (File menu)

Use this command to load variables that make up the texture and noise parameters. This also loads the palette, coloring filter, orbit trap and coloring options in a texture file [qtx].

### 3.6.4 Open [JPG] command

#### Open [JPG] command (File menu)

Use this command to load parameters and a bitmap file that were saved in jpeg format. There is an option in the file-type box to load only the bitmap too. This replaces the Open command for those who need a smaller sized bitmap file. Note: the last files list doesn't keep track of images loaded in JPEG format.

### 3.6.5 Open [PNG] command

#### Open [PNG] command (File menu)

Use this command to load parameters and a bitmap file that was saved in png format. There is an option in the file-type box to load only the bitmap too. This replaces the Open command for those who need a smaller sized bitmap file. Note: the last files list doesn't keep track of images loaded in PNG format.

### 3.6.6 File Load Text Data [ORT) command

#### Load Text Data [ORT) command

Load text (platform-independent) data file. The fractal data is entered into the active figure.

## 3.7 Save Other

### 3.7.1 Parameters command

#### Save Parameters command (File menu)

Use this command to save all data elements for the current image in a data file [.orc].

### 3.7.2 Palette command

#### Save Palette command (File menu)

Use this command to save a palette for the current image in a palette file [.pqz]. Also saves the Coloring Filter used for surface mapping.

### 3.7.3 Texture command

#### Save Texture command (File menu)

Use this command to save the variables that make up the texture and noise parameters for the current figure. This also saves the palette, coloring filter, orbit trap and coloring options in the texture file [qtx].

### 3.7.4 Save As [JPG] command

#### Save As [JPG] command (File menu)

Use this command to save the parameters and active bitmap in jpeg format. There is an option in the file-type box to save only the bitmap too. This replaces the Save and Save As command for those who need a smaller sized bitmap file. Note: the last files list doesn't keep track of images saved in JPEG format.

### 3.7.5 Save As [PNG] command

#### Save As [PNG] command (File menu)

Use this command to save the parameters and active bitmap in png format. There is an option in the file-type box to save only the bitmap too. This replaces the Save and Save As command for those who need a smaller sized bitmap file. Note: the last files list doesn't keep track of images saved in PNG format.

### 3.7.6 File Save Text Data [ORT) command

#### Save Text Data [ORT) command

Save the data for the active figure in text (platform-independent) format.

## 3.8 Import

### 3.8.1 Palette command

#### Import -> Palette [MAP] command (File menu)

Use this command to load a Fractint-type map file. The palette in the map file replaces the currently selected palette.

## 3.9 Export

### 3.9.1 Save As [OBJ] command

#### Export -> Save as [OBJ] command (File menu)

Use this command to save a 3-D fractal as a true 3-D object. This uses John C. Hart's Implicit

code (Quaternion Julia Set server) to polygonize a 3-D fractal formula, and then writes the triangles to a Wavefront object file. The memory requirements for this routine are 20MB or more for a typical Julia set 3-D fractal rendered at 320X240. The output file can be very large too, 4MB or more, depending on the precision required. The higher the precision, the smoother the finished object becomes. Precision is set with the Steps variable in the Fractal Parameters window, where  $\text{precision} = 10 / \text{Steps}$ .

Note: some formulas produce asymmetrical object files with this routine, where one side of the q polygon isn't resolved completely. Usually one side is markedly smoother in this case.

### 3.9.2 Simplify option

#### Export -> Simplify option (File menu)

With this option selected (default on) if the Save as OBJ command is executed the resulting polygon mesh is simplified according to Garland's QSlm algorithm before being output as a Wavefront obj file.

### 3.9.3 Save As [POV] command

#### Export -> Save as [POV] command (File menu)

Use this command to save a 3-D fractal as a true 3-D object. This uses John C. Hart's Implicit code (Quaternion Julia Set server) to polygonize a 3-D fractal formula, and then outputs the triangles to a pov file. The pov file is written as a simple scene, the triangles part of a "union" object, with camera and lighting elements compatible with POV 3.5. This can be used as a starting point for more complex compositions. The memory requirements for this routine are 20MB or more for a typical Julia set 3-D fractal rendered at 320X240. The output file can be very large too, up to 40MB or more, at the highest precision. The higher the precision, the smoother the finished object becomes. Precision is set with the Steps variable in the Fractal Parameters window, where  $\text{precision} = 10 / \text{Steps}$ .

Note: some formulas produce asymmetrical object files with this routine, where one side of the q polygon isn't resolved completely. Usually one side is markedly smoother in this case.

### 3.9.4 Smooth option

#### Export -> Smooth option (File menu)

With this option selected (default on) smooth normals are calculated for the POV triangle mesh and the polygonized object is output as a POV mesh with smooth\_triangles. Effective when the Save as POV command is executed.

### 3.9.5 Set Max Faces command

#### Export -> Set Max Faces command (File menu)

Here you can set the target face size for a Wavefront object, if the Simplify option is selected. The face size can range from 1000 to 500,000 faces. This allows you to reduce the size of the

Wavefront object file by a factor of 30 or more and still retain the essential image detail. Use smoothing in Bryce to eliminate most of the triangle artifacts. Before exporting the polygon as an obj file, it helps to make the mesh resolution as high as practical by increasing the Steps size in the Fractal Parameters window to a suitable value. This varies with the complexity of the 3-D figure. The face size limits the object file size by reducing faces on the polygon until the face limit is reached, so you never export a polygon with more than n-size faces. It's possible that there could be fewer faces than the face limit, and in that case no mesh reduction is performed. But usually you'll see a dramatic reduction in object faces (and obj file size) if the Steps size is set to a value greater than 200 (the startup default).

### 3.9.6 Save As [STL] command

#### Export -> Save As [STL] command (File menu)

Use this command to save a 3-D fractal as a true 3-D object. This uses John C. Hart's Implicit code (Quaternion Julia Set server) to polygonize a 3-D fractal formula, and then writes the triangles to a STL solid file. STL files are used with 3-D printers and other machinery. The memory requirements for this routine are high, 20MB or more for a typical Julia set 3-D fractal rendered at 320X240. The output file can be very large too, 2MB or more, depending on the precision required. The higher the precision, the smoother the finished object. Precision is set with the Steps variable in the Fractal Parameters window, where  $\text{precision} = 10/\text{Steps}$ . See also the [Simplify mesh](#) command for ways to reduce object file size.

Note: some formulas produce unsymmetrical object files with this routine, where one side of the q polygon isn't resolved completely. Usually one side is markedly smoother in this case.

### 3.9.7 Save As [WRL] command

#### Export -> Save as [WRL] command (File menu)

Use this command to save a 3-D fractal as a true 3-D object. This uses John C. Hart's Implicit code (Quaternion Julia Set server) to polygonize a 3-D fractal formula, and then writes the triangles to a virtual reality file. The memory requirements for this routine are 20MB or more for a typical Julia set 3-D fractal rendered at 320X240. The output file can be very large too, 4MB or more, depending on the precision required. The higher the precision, the smoother the finished object. Precision is set with the Steps variable in the Fractal Parameters window, where  $\text{precision} = 10/\text{Steps}$ .

Note: some formulas produce asymmetrical object files with this routine, where one side of the q polygon isn't resolved completely. Usually one side is markedly smoother in this case.

### 3.9.8 Save As [DXF] command

#### Export -> Save as [DXF] command (File menu)

Use this command to save a 3-D fractal as a true 3-D object. This uses John C. Hart's Implicit code (Quaternion Julia Set server) to polygonize a 3-D fractal formula, and then writes the

triangles to an AutoCad dxf file. The memory requirements for this routine are 20MB or more for a typical Julia set 3-D fractal rendered at 320X240. The output file can be very large too, 4MB or more, depending on the precision required. The higher the precision, the smoother the finished object becomes. Precision is set with the Steps variable in the Fractal Parameters window, where  $\text{precision} = 10/\text{Steps}$ .

Note: some formulas produce asymmetrical object files with this routine, where one side of the q polygon isn't resolved completely. Usually one side is markedly smoother in this case.

### 3.9.9 Save As [PLY] command

#### Export -> Save as [PLY] command (File menu)

Use this command to save a 3-D fractal as a true 3-D object. This uses John C. Hart's Implicit code (Quaternion Julia Set server) to polygonize a 3-D fractal formula, and then writes the triangles to a Ply (polygon format) object file. The memory requirements for this routine are 20MB or more for a typical Julia set 3-D fractal rendered at 320X240. The output file can be very large too, 4MB or more, depending on the precision required. The higher the precision, the smoother the finished object becomes. Precision is set with the Steps variable in the Fractal Parameters window, where  $\text{precision} = 10/\text{Steps}$ .

Note: some formulas produce asymmetrical object files with this routine, where one side of the q polygon isn't resolved completely. Usually one side is markedly smoother in this case.

### 3.9.10 Set Max Vertices command

#### Set Max Indices (File menu)

Use this command to set the maximum number of indices that are allocated by the polygonizing routine. Default is 5,000,000 indices. Use less to limit the amount of memory used while polygonizing. Use more if necessary for higher resolution. Note: unless you have an application that can use very large object files, there's a limit to how much resolution is obtainable with the polygonizing routine. Bryce4 has problems with object files produced by Orca that are much larger than 2.5MB (on systems other than Win XP.)

### 3.10 File 1, 2, 3, 4, 5, 6 command

#### 1, 2, 3, 4, 5, 6 command (File menu)

Use the numbers and filenames listed at the bottom of the File menu to open the last six drawings you closed. Choose the number that corresponds with the drawing you want to open.

## 3.11 Exit command

### Exit command (File menu)

Use this command to end your Orca session. You can also use the Close command on the application Control menu. Note: if you choose to exit while plotting, the program does not terminate, but stops the plotting so the program can be safely exited.

#### Shortcuts

Mouse: Double-click the application's Control menu button.

Keys: ALT+F4

## 4 Edit Menu

### Edit menu commands

The Edit menu offers the following commands:

<a href="#">Undo</a>	Undo last edit, action or zoom.
<a href="#">Copy</a>	Copy the active view and put it on the Clipboard.
<a href="#">Clip</a>	Define area of view and copy to clipboard.
<a href="#">Paste</a>	Insert Clipboard contents.
<a href="#">Copy Data</a>	Copy fractal data to buffer.
<a href="#">Paste Data</a>	Paste data from copy buffer.
<a href="#">Formula Parameters</a>	Edit formula parameters.
<a href="#">Drawing Parameters</a>	Edit drawing window parameters.
<a href="#">Size</a>	Sets the image size.
<a href="#">Fractal Parameters</a>	Edit fractal parameters.
<a href="#">Ray-Tracing Variables</a>	Edit lighting and viewpoint variables.
<a href="#">Palette Editor</a>	Edit palette.
<a href="#">Preferences</a>	Startup preferences and defaults.

## 4.1 Undo command

### Undo command (Edit menu)

Use this command to undo the last action. An image cannot be continued after an undo.

#### Shortcut

Keys: CTRL+Z

## 4.2 Copy command

### Copy command (Edit menu)

Use this command to copy the active view to the clipboard. The entire view is copied to the clipboard.

#### Shortcut

Keys: CTRL+C

## 4.3 Clip command

### Clip command (Edit menu)

Use this command to copy a part of the active view to the clipboard. A zoom box is used to select the part to be copied. Click outside the view frame or press escape to exit this option.

#### Shortcut

Keys: CTRL+L

## 4.4 Paste command

### Paste command (Edit menu)

Use this command to paste from the clipboard. The clipboard must contain a bitmap. If the bitmap is larger than the view, it is clipped. The zoom cursor is used to set the left/top corner in the view where the bitmap will be pasted. Click outside the view frame or press escape to exit this option.

#### Shortcut

Keys: CTRL+V

## 4.5 Copy Data command

### Copy Data command (Edit menu)

Use this command to copy the fractal data for the active view to the file "c:\zcopy.orc". The current palette for the view is also copied.

#### Shortcut

Keys: CTRL+F

## 4.6 Paste Data command

### Paste Data command (Edit menu)

Use this command to paste the data in the file "c:\zcopy.orc" to the active view.

#### Shortcut

Keys: CTRL+R

## 4.7 Formula Parameters

### Formula Parameters

Function is the combo control for selecting the formula used to generate the fractal. There are additionally two fractal Type controls, an Arg control, and an 'S' control that are used in various fractal formulas and user-defined functions. User-defined functions are supplied through list boxes fn1 and fn2. Although there are only 20 built-in formulas in Orca, all of the formulas are generalized and can use up to two user-defined functions (out of a total of 52) and two fractal types, from a list of four types, quaternion, hypernion, compquat and juliat. These Types specify the type of quad math used in calculating the formula. The types are switched at various stages of the formula calculations, so that in effect you can merge the two fractal types into a totally different fractal type, a hybrid type, if you want. Note: some user-defined functions are only defined as quaternion or hypercomplex (hypernion) math. When the fractal type is neither of these, the math defaults to hypercomplex. This is true for all transcendental, logarithmic and power functions, except  $w^{(int)s}$ .

The Bail box is used to enter an optional bailout string, such as " $|z|<4$ " or " $z=\sin(z), x<4$ " (without the quotes). This supersedes any bailout defined by the Mapping menu and Bailout variable in the Fractal Parameters window. A list of functions supported by the Bail box is listed in [Parser Information](#).

The three buttons named Random function, Random fn1-fn2, and Random Types are used to pick formulas, functions, or types at random. Clicking on Random Function a formula is chosen (from the 20 built-in formulas) for Function. Clicking on Random f1-f2 randomizes both user-defined functions. Clicking on Random Types, both fractal types are randomized.

Click on the Okay button to use the formulas currently displayed in the window, or Cancel to exit the window without making any changes. Click on Apply to apply a new formula, etc. without closing the Formula window.

The Reset button returns all boxes and slider values to their original values when the window was opened.

## 4.8 Drawing Parameters

### Drawing Parameters Window

The Size slider controls the overall size of the picture. The Size slider sets the horizontal resolution, while the vertical resolution is then scaled according to the full-screen VGA ratio, 4 to 3 (1:1 if that aspect is selected through the Size option.) The Sector slider controls which of 4 sectors the picture will be drawn in, if the Size is less than or equal to (the full-screen horizontal resolution)/2. Otherwise the picture is centered according to the full-screen dimensions. This allows you to show zooms of a particular function by using different sectors, or show the affect of different plotting options. Each sector is erased individually. Note: if you try to continue a plot in a different sector than you started with, the plot will continue in the original sector. The Thumbnail button next to the Size slider is used to set a thumbnail size quickly. The thumbnail size toggles between 1/4 and 1/8 of the horizontal screen resolution, e.g. 200X150 or 100X75 for an 800X600 screen.

Select the Okay button to start a new plot from column 1.

The Reset button returns all boxes and slider values to their original values when the window was opened.

Related Topic:

[Fractal Parameters](#) describes the fractal generator's data-collection window.

## 4.9 Size command

### Size (Edit menu)

This allows you to set the drawing area for a picture, independent of the Windows screen size. It also shows which size is currently in use. The aspect for the drawing is based on the ratio of X (horizontal width) to Y (vertical height.) The size of an image can range in standard 4/3 and 1/1 aspects from 160X120 to 3600X2700 or you can choose a custom XY size. The custom setting allows for any size/aspect that system memory will permit. The minimum size for an image is 40X30. Note: Solid-guessing mode is disabled if the drawing aspect is other than 4/3 or 1/1. If the image is less than 100 width, the aspect must be 4/3 for solid guessing to work properly.

## 4.10 Fractal Parameters

### Fractal Parameters Window

This is the data-collection window for the 3-D and 2-D generators.

Min Z and Max Z define the third dimension Z space that is used to map the quad image. Normally Min Z is the negative of Max Z, but Min Z can be adjusted in the positive direction to shear off the front of the quad object. This has the effect of exposing the insides of a quad set.

Quad constants are cr, ci, cj and ck.

Three rotate variables determine the 3-D angle of rotation.

The Bailout variable can range from .000001 to 65000. For most escape-time formulas that have an attractive point at infinity, the bailout is set to a value 4 or greater. A larger value tends to make the 3-D figure smoother and fuller with some loss of detail.

Steps and Fine Tune are pitch adjustments that bear on the quality of the 3-D plot at the expense of lengthier calculations.

The Slice variables may be altered to display different planes of the quad set.

Use the Random Rotate button to set random values (0-360) for the Rotation variables.

The scaling variable is used with 2-D plots to increase or decrease color useage, and with bubble and orbit-trap methods when used as 2-D fractals or 3-D surfaces. Selecting the Carlson option (in the Orbit-Traps window) or clicking on the Bubble Extensions button (in the coloring options window) automatically adjusts this variable to a suitable value. Hint: increase its magnitude to make the bubbles larger, but keep the value negative.

## 4.11 Ray-Tracing Variables

### Ray-Tracing Window

The LightPoint variables (lightx thru lightz) determine the direction of the light source used in the ray-tracing algorithm. The ViewPoint represents the angle, at which the object is ray-traced, which can affect Phong highlights greatly. This has no effect on the camera view.

The Lighting variables shininess, highlight, gamma and ambient are used to adjust ambient light and highlights. The ranges for these variables appear beside their label. Decreasing the shininess value increases light reflected by the 3-D fractal and the apparent sheen on the 3-D fractal's surface. The ambient value controls the amount of ambient light that illuminates the 3-D fractal. The highlight value increases or decreases the specular (Phong) highlighting, while the gamma value increases or decreases the intensity of the light source's illumination. Once a plot is started, the lighting variables and light point can be changed without redrawing the 3-D fractal.

Click the Apply button to redisplay a plot after changing the lighting variables or light point. Click the Okay button to close the Ray-Tracing Window, applying new settings, if the variables were modified. Click on Cancel to revert to the state that existed when the ray-tracing window was opened. Click on Defaults to set the lighting and viewpoint variables to the built-in defaults for these variables.

## 4.12 Palette command

### Palette command (Edit menu)

Use the palette editor to modify the palette(s) in use.

It is important to realize that palettes are software-simulated in Orca (since 24-bit color supports no hardware palettes), so color cycling and palette switching are not fast operations as with a 256-color system that supports palettes.

There are copy and spread options to smooth or customize the existing palettes in Orca. You can then save all the palettes in a .pl file, or by saving the entire function and bitmap.

Colors are shown in 8 groups of 32 colors. This makes it easy to create split palettes from 256 color indexes. With Orca, a palette is actually 65280 colors, with each succeeding color (except the last) followed by 255 colors that are evenly spread from one color to the next. The background color is shown separately, as it is not used to derive split palettes.

Use the RGB-slider controls to edit any color in the palette. Select Copy to copy any color to another spot in the palette. Select Spread to define a smooth spread of colors from the current spot to another spot in the palette. Copy and Spread take effect immediately when you select another spot with the mouse button. You can cancel the operation with the Cancel button. In Orca, colors do not cycle smoothly when you adjust the RGB/HSV sliders. This would be too slow with true color. The Map button is used to map color changes to an image after you are done adjusting the sliders. In the HSV mode, color spreads are based on HSV values instead of RGB values, which in some cases results in brighter color spreads.

Right-click on any point on the main window and the palette color for that pixel will be displayed in the palette editor. You can use any of the color-cycling keys (after clicking on the main window) to see the effects of the cycling in the palette editor window. Note: color cycling and color-selection-from-pixel only works when the image has been drawn in the current session. If you load a pre-existing image file, you must redraw it to cycle colors, etc. Anti-aliasing, and the composite figure option also disable color cycling.

Use Reset to reset the colors of the palette in use, to where it was before it was cycled or modified. Note: if you change palettes with one of the function keys, any modifications to a previous palette are unaffected by the Reset button.

Use Reverse to reverse the order of the colors in the palette. This affects only those colors in the start-color to end-color range.

Use Neg to create a palette that is the complement of the current palette.

Use SRG to switch the red and green components of all palette colors.

Use SRB to switch the red and blue components of all palette colors. SRB and SRG are disabled in HSV mode. You can use these buttons to form eight different palettes by repeatedly switching red, green and blue components.

Use the Random palette button to randomize the current palette. The Randomize variables, rmin, rmax, bmin, bmax, gmin, and gmax act as limits that are applied after the palette after initial randomizing, to make the palette conform to the desired spectrum of colors.

Note: unless you click on Reset before exiting the editor, changes are permanent to the palette edited, no matter which way you close the editor (Okay button or close box.)

#### **4.12.1 Reverse button**

##### **Reverse button**

Use Reverse to reverse the order of the colors in the palette. This affects only those colors in the start-color to end-color range. This is useful for reversing divide-by-eight palettes, etc., for orbit-trap pictures that require a reversed palette.

#### **4.12.2 Neg Button**

##### **Neg button**

Use Neg to create a palette that is the complement of the current palette.

#### **4.12.3 Map Button**

##### **Map button**

In Orca, colors do not cycle smoothly when you adjust the RGB/HSV sliders. This would be too slow with true color. The Map button is used to map color changes to an image after you are done adjusting the sliders.

#### **4.12.4 H/R Button**

##### **H/R button**

Change from HSV to RGB mode or back. In the HSV mode, color spreads are based on HSV values instead of RGB values, which in some cases results in brighter color spreads.

#### **4.12.5 Spread Button**

##### **Spread button**

Select Spread to define a smooth spread of colors from the current spot to another spot in the palette.

#### **4.12.6 Copy Button**

##### **Copy button**

Select Copy to copy any color to another spot in the palette.

#### **4.12.7 SRG Button**

##### **SRG button**

Use SRG to switch the red and green components of all palette colors. This is for RGB mode only.

#### **4.12.8 SRB Button**

##### **SRB button**

Use SRG to switch the red and blue components of all palette colors. This is for RGB mode only.

#### **4.12.9 Okay Button**

##### **Okay button**

Click on Okay to exit the palette editor, applying unmapped color changes to picture (if color-cycling is enabled.)

#### **4.12.10 Reset Button**

##### **Reset button**

Use Reset to reset the colors of the palette in use, to where it was before it was cycled or modified. Note: if you change palettes with one of the function keys, any modifications to a previous palette are unaffected by the Reset button.

#### **4.12.11 Cancel Button**

##### **Cancel button**

You can cancel a copy or spread operation with the Cancel button.

#### **4.12.12 Red Slider**

##### **Red slider**

Use the RGB/HSV-slider controls to edit any color in the palette.

#### **4.12.13 Green Slider**

##### **Green slider**

Use the RGB/HSV-slider controls to edit any color in the palette.

#### **4.12.14 Blue Slider**

##### **Blue slider**

Use the RGB/HSV-slider controls to edit any color in the palette.

#### 4.12.15 Red edit box

##### Red edit box

Shows red/hue value of selected color index.

#### 4.12.16 Green edit box

##### Green edit box

Shows green/saturation value of selected color index.

#### 4.12.17 Blue edit box

##### Blue edit box

Shows blue/value magnitude of selected color index.

#### 4.12.18 Random Palette Button

##### Random palette button

Use to create a random palette. Fast way to define palettes.

### 4.13 Preferences command

#### Preferences (Edit menu)

Each time you use the Reset command, Orca restores data variables to built-in defaults. The Set Defaults button allows you to change some of the data variable defaults to whatever the current settings are. Some of the customizable variables include step, fine, formula, viewpoint, lighting, rotational angles, Phong and x/y space. The new Reset defaults are saved in the file "prefs.txt" when you close the program (if the Defaults check box is selected.) The check boxes in the group "Save on Program Close" allow you to change the default startup mode of a few Auto options, such as Auto Redraw, and the Random Setup variables. By keeping the boxes selected, Orca saves the last changes you make to these options. If you want to go back to the initial settings (the way Orca was packaged originally) you can click on the Reset Defaults button. This restores the data, Auto variables and random setup defaults.

Use the Default Directories tab to change the default directories for saved and loaded items in Orca. Click on the "... " button next to each default directory box, and use the folder requester to pick a different directory, or create a new directory with the Make New Folder button. The default directories are saved at program close in the Registry and reloaded when you next open Orca.

## 5 Image Menu

### Image menu commands

The Image menu offers the following commands:

<a href="#"><u>Draw</u></a>	Draw the picture.
<a href="#"><u>Draw Composite</u></a>	Draw composite from figures 1-4.
<a href="#"><u>Plot To File</u></a>	Plot large bitmap images directly to png file.
<a href="#"><u>Plot Files In Directory</u></a>	Disk render .orc files in working directory.
<a href="#"><u>Auto Redraw</u></a>	Redraw image on command.
<a href="#"><u>Auto Clear</u></a>	Clear drawing area before new plot.
<a href="#"><u>Auto Remote</u></a>	Open remote automatically at startup.
<a href="#"><u>Merge Sum</u></a>	Merge current pixel color with previous color summing colors.
<a href="#"><u>Merge And</u></a>	Merge current pixel color with previous color anding colors.
<a href="#"><u>Merge Or</u></a>	Merge current pixel color with previous color oring colors.
<a href="#"><u>Merge High</u></a>	Merge current pixel color with previous color by choosing highest rgb.
<a href="#"><u>Merge Low</u></a>	Merge current pixel color with previous color by choosing lowest rgb.
<a href="#"><u>Merge Black</u></a>	Merge current pixel color with previous color by excluding black (0,0,0).
<a href="#"><u>Merge Diff</u></a>	Merge current pixel color with previous color by using difference of colors.
<a href="#"><u>Hide Dialogs</u></a>	Hide dialogs for active drawing.
<a href="#"><u>Show Dialogs</u></a>	Show drawings for active drawing.
<a href="#"><u>Abort</u></a>	Abort drawing.
<a href="#"><u>Continue</u></a>	Continue drawing.
<a href="#"><u>Zoom</u></a>	Zoom into rectangle.
<a href="#"><u>New View on Zoom</u></a>	New view on zoom.
<a href="#"><u>Clone</u></a>	Clone current view.
<a href="#"><u>Pilot</u></a>	Use Pilot to rotate figure and alter key cubic variables.
<a href="#"><u>Scan</u></a>	Scan Mandelbrot border for 3-D fractal Julia set.
<a href="#"><u>Dive</u></a>	Peel off outer layer of 3-D fractal.
<a href="#"><u>Ray Trace</u></a>	Ray trace 3-D plot.
<a href="#"><u>Reset Ranges</u></a>	Reset z-space
<a href="#"><u>Reset Figure</u></a>	Reset current figure
<a href="#"><u>Figure 1</u></a>	Switch to figure one.
<a href="#"><u>Figure 2</u></a>	Switch to figure two.
<a href="#"><u>Figure 3</u></a>	Switch to figure three.
<a href="#"><u>Figure 4</u></a>	Switch to figure four.
<a href="#"><u>Composite</u></a>	Select figures to merge.

## 5.1 Draw command

### Draw command (Image menu)

Use this command to draw or redraw the image for the current fractal variables. Clicking inside the draw window with the left-mouse button stops all plotting. Use the [Continue](#) command to restart plotting from the current column.

## 5.2 Draw Composite command

### Draw Composite command (Image menu)

Use this command to draw or redraw an image defined in the Composite command as a merging of figures 1-4. Clicking inside the draw window with the left-mouse button stops all plotting. [Continue](#) is disabled for this command.

## 5.3 Plot to file

### Plot to File (Image menu)

This allows you to plot a large bitmap directly to a .png file without the added system requirements of keeping the whole bitmap in memory. The Target group sets the bitmap resolution (width 800 to 14400. Drawing aspect is that of the current image.) Click on Okay to set the target file name and start a new plot to file. Note: the 3200X2400 bitmap size is suitable for 8 1/2X11 printouts at 320-720 dpi. The larger bitmap sizes are suitable for poster-size printouts. This option is not available with the merging options, or with anti-aliasing. Also, [solid guessing](#) is disabled when using this option.

## 5.4 Plot Files in Directory

### Plot Files in Directory (Pixel menu)

Allows you to plot a set of large bitmaps directly to a .png files without the added system requirements of keeping any of the images in memory. The Target group sets the bitmap resolution (width 800 to 14400. Drawing aspect is that of the current image.) All data files (.orc) in the working directory are enlarged to this resolution. Click on Okay to start. Note: the 3200X2400 bitmap size is suitable for 8 1/2X11 printouts at 320-720 dpi. The larger bitmap sizes are suitable for poster-size printouts. Merging, anti-aliasing and [solid guessing](#) are disabled when using this option.

## 5.5 Auto

### 5.5.1 Redraw command

#### Auto Redraw command (Image menu)

With this command disabled (on by default), redraw does not occur except when the [Draw](#) command is executed, or [Continue](#). Most of the time you want to see the results of changing

a parameter or mapping option, so redraw occurs automatically with parameter or mapping changes. Sometimes you want to change more than one parameter before redrawing the image. So you need to turn this option off then.

### 5.5.2 Clear command

#### Auto Clear command (Image menu)

With this command enabled (on by default), the drawing area is cleared before starting a new plot. You can turn off this option when you want to see the effect of minor changes to parameters, as they affect the plot pixel by pixel, or when setting up a multiple-layered fractal. Note: when you disable auto clear, no pre-image is drawn while the image is being calculated, and any background image (loaded through Open [Jpeg] or Open [Png]) is retained. You can use the shift-c command ([hot keys](#)) to clear the drawing area at any time.

### 5.5.3 Auto Remote command

#### Auto Remote command (Image menu)

With this command enabled (on by default), the [remote](#) is opened immediately at program startup. Handy if you find the remote useful and don't want to click on the toolbar button each time the program starts up.

## 5.6 Merge Colors

### 5.6.1 Merge Sum command

#### Merge Sum command (Image menu)

With this command enabled (off by default), current pixel color is not overwritten when a new image is drawn. Instead the colors are merged using a summing algorithm. The [auto-clear](#) option must be disabled and [solid guessing](#) off to choose this option. This is useful to merge two or more separate fractal images/types with the initial image(s) "bleeding" through.

### 5.6.2 Merge And command

#### Merge And command (Image menu)

With this command enabled (off by default), current pixel color is not overwritten when a new image is drawn. Instead the colors are merged using an anding algorithm. The [auto-clear](#) option must be disabled and [solid guessing](#) off to choose this option. This is useful to merge two or more separate fractal images/types with the initial image(s) "bleeding" through.

### 5.6.3 Merge Or command

#### Merge Or command (Image menu)

With this command enabled (off by default), current pixel color is not overwritten when a new image is drawn. Instead the colors are merged using an oring algorithm. The [auto-clear](#) option must be disabled and [solid guessing](#) off to choose this option. This is useful to merge two or more separate fractal images/types with the initial image(s) "bleeding" through.

### 5.6.4 Merge High command

#### Merge High command (Image menu)

With this command enabled (off by default), current pixel color is not overwritten when a new image is drawn. Instead the colors are merged using the highest rgb values of both images. The [auto-clear](#) option must be disabled and [solid guessing](#) off to choose this option. This is useful to merge two or more separate fractal images/types with the initial image(s) "bleeding" through.

### 5.6.5 Merge Low command

#### Merge Low command (Image menu)

With this command enabled (off by default), current pixel color is not overwritten when a new image is drawn. Instead the colors are merged using the lowest rgb values of both images. The [auto-clear](#) option must be disabled and [solid guessing](#) off to choose this option. This is useful to merge two or more separate fractal images/types with the initial image(s) "bleeding" through.

### 5.6.6 Merge Black command

#### Merge Black command (Image menu)

With this command enabled (off by default), the current pixel color is not overwritten when a new image is drawn. Instead the colors are merged using the rgb components of the new image, if the current pixel color is black (0,0,0). The [auto-clear](#) option must be disabled and [solid guessing](#) off to choose this option. This is useful to merge two or more separate fractal images/types with the initial image(s) "bleeding" through (i.e. if the background color of the initial image is black).

### 5.6.7 Merge Diff command

#### Merge Diff command (Image menu)

With this command enabled (off by default), current pixel color is not overwritten when a new image is drawn. Instead the colors are merged using the difference of the rgb values of both images. The [auto-clear](#) option must be disabled and [solid guessing](#) off to choose this option. This is useful to merge two or more separate fractal images/types with the initial image(s) "bleeding" through.

## 5.7 Hide dialogs command

### Hide dialogs command (Image menu)

Use this command to hide all open non-modal dialogs in the active window. This helps to de-clutter the screen and avoid confusion if two or more draw windows are open. Each draw window has its own dialogs. Disabled if no dialogs are open.

## 5.8 Show dialogs command

### Show dialogs command (Image menu)

Use this command to show all open non-modal dialogs in the active window. This command restores any dialogs that may have been hidden by the [Hide dialogs](#) command. Each draw window has its own dialogs. Disabled if no dialogs are open or hidden. Note: you can restore individual dialogs by selecting the command that opened them originally.

## 5.9 Abort command

### Abort command (Image menu)

Use this command to stop drawing. Clicking inside a window's drawing area or close box (or the program close box) will also stop the drawing. Note: once a plot has started Orca continues to draw the image for that window regardless of which drawing window has the input focus, until done or aborted. You can open and close other drawing windows without affecting the current drawing, but only one drawing is active at any time.

## 5.10 Continue Draw

### Continue Draw (Image menu)

Continues a plot that was aborted early. The plot is restarted at the beginning of the last row drawn. Continue is disabled when an Image/Merge option is selected. Continue isn't available for 3-D images that have been reloaded from a previous drawing session or after an Undo.

## 5.11 Zoom command

### Zoom (Image menu)

Turns on zoom mode, so that detail of the current plot may be magnified. Alternatively, just click inside any drawing window, move the mouse, and the zoom box will appear. Using the mouse, move the zoom box over the portion of the plot you wish to magnify. Hold the left mouse button to shrink the box or the right button to enlarge it. Use the up and down arrow keys to squash or expand the box, changing the aspect of the image. Use the left and right arrow keys to rotate the box counter-clockwise or clockwise (2-D map only). Use the Shift key to enlarge the zoom box X4 for quickly zooming outward. Use the Ctrl key to shrink the zoom box by 4. You start a zoom by pressing the space bar. You abort a zoom by clicking outside the main window or in the title bar, or by pressing the escape key. The program will begin a new plot at the new coordinates. You may zoom in by defining a box inside the current drawing area. You zoom out by drawing a box outside the current drawing area. The outer zoom limits are between -1000 and 1000.

## 5.12 New View on Zoom command

### New view on zoom (Image menu)

With this option enabled, a new window is opened with each [zoom](#), instead of the zoom box area replacing the original image. Ignored in avi mode.

## 5.13 Clone command

### Clone (Image menu)

A new draw window is opened that contains the same fractal data as the window it was opened from. This is useful for comparing minor changes in texturing options, etc. Similar to using the copy/paste data commands except that all figures are copied to the new view.

## 5.14 Pilot command

### Pilot (Image menu)

Opens the Pilot window to adjust key parameters, rotate, zoom and redraw the figure interactively. The current image is reduced to one quarter normal for faster redraw. Each click on a Pilot button increments or decrements a parameter. The Speed slider controls the rate at which the buttons operate (default is 10.)

Press the space bar or Click on Ok to open a new window and draw the altered image full-size. Press Esc or click on Cancel to exit this mode without opening a new window. Note: when using this option while an AVI stream is open, a new window isn't opened, but the altered figure is drawn in the current draw window, the changed parameters replacing the previous ones.

## 5.15 Scan command

### Scan (Image menu)

This is equivalent to the [Shift+G hot key](#) when the Type is 3-D Map or [Shift+J hot key](#) if the Type is 2-D Map.

## 5.16 Dive command

### Dive (Image menu)

Select Dive to go beneath the surface of a 3-D fractal. Some 3-D fractals have a smooth border that doesn't show the turbulence below the surface. Using the Dive option strips off the border layer to reveal what's underneath, if anything, else the border layer is retained.

## 5.17 Ray Trace command

### Ray Trace (Image menu)

Uses Frode Gill's ray-tracer algorithm to add a light source to 3-D plots. Color palettes should be continuous (dark to light to dark) to take best advantage of this option. The light source parameters may be altered in the [Ray-Tracing Variables](#) window. This option is the default. Note: if you prefer to generate 3-D fractals without ray tracing, deselect this flag before drawing the plot. The image draw will be the pre-image, using the existing palette, as is, without ray-tracing (Phong or shading.)

## 5.18 Full Screen command

### Full Screen (Image menu)

Displays the entire plot, expanding or shrinking the image to fit in a maximized window without title bar, scroll bars or menu bar. At all other times, part of the picture is hidden by the inclusion of the title bar, toolbar, scroll bars and menu bar. To exit full-screen mode, press any key or click the left-mouse button.

## 5.19 Reset Ranges

### Reset Ranges

The Ranges Only command resets only the real Z and imaginary Z ranges in the Parameters window (to +/-2.0 and +/-1.5.) No other menus or variables are affected. This is useful in conjunction with the "P" command to generate and view Julia sets. After setting the complex-C variable via shift-P (Caps Lock off), you need to reset the Z ranges to see the entire Julia set after zooming into a Mandelbrot set.

## 5.20 Reset Figure

### Reset Figure

Reset the current figure or all figures to an empty Mandelbrot. All functions in the New Formula data are blanked. All options on the Flags menu are reset to their default settings.

## 5.21 Figure

### 5.21.1 1

#### Figure #1 (Image menu)

Switch to Function #1. Current settings are saved for the previous image.

### 5.21.2 2

#### Figure #2 (Image menu)

Switch to Function #2. Current settings are saved for the previous image.

### 5.21.3 3

#### Figure #3 (Image menu)

Switch to Function #3. Current settings are saved for the previous image.

### 5.21.4 4

#### Figure #4 (Image menu)

Switch to Function #4. Current settings are saved for the previous image.

### 5.21.5 Composite command

#### Composite command (Image menu)

Opens the Composite Figure window, where you can define a set of figures to merge into one image. All the merging options in the Merge Color menu are supported, plus "ALL" which is usually used for the first figure to be drawn. The "ALL" option transfers all rgb information for a figure to the drawing area, without checking the rgb state of the pixel. You can define up to four figures (layers), as part of the composite, but each figure should contain an image (if used in the composite.)

## 6 Type Menu

### Type menu commands

The Type menu offers the following commands:

<a href="#">2-D Map</a>	Set fractal type to two-dimensional mapping.
<a href="#">3-D Map</a>	Set fractal type to three-dimensional mapping.
<a href="#">Mandelbrot0</a>	Mandelbrot set (orbit starts at zero.)
<a href="#">MandelbrotP</a>	Mandelbrot set (orbit starts at zpixel.)
<a href="#">Julia</a>	Julia set.

### 6.1 2-D Map

The fractal type is set to 2-D. Use this command to create standard 2-D fractals. Bailout, max iterations and complex 'c' are set in the [Fractal Parameters](#) window.

### 6.2 3-D Map

The fractal type is set to 3-D. Use this command to create true 3-D fractals. The figure dynamics vary with the type of quad math used. The math type is set in the [Formula Parameters](#) window.

## 6.3 Mandelbrot0

### Mandelbrot0 (Type menu)

Mandelbrots base their mapping on varying inputs of complex  $C$ , which corresponds to the min/max values set in the Parameters window. With Mandelbrot0, the initial value of  $Z$  is set to zero.

## 6.4 MandelbrotP

### MandelbrotP (Type menu)

Mandelbrots base their mapping on varying inputs of complex  $C$ , which corresponds to the min/max values set in the Parameters window. With MandelbrotP, the initial value of  $Z$  is set to the value of the pixel being iterated.

## 6.5 Julia

### Julia (Type menu)

Julia sets normally have a fixed complex  $C$ , with varying inputs of  $Z$ . This option generates the so-called 'filled-in' Julia set, which includes non-escaping points as well as the Julia set.

Julia from Mandelbrot

Julia set

## 7 Map menu

### Map menu commands

The Map menu offers the following commands:

[Z-Real-Z-Imag](#)  
imaginary parts of  $Z$ .

Mapping based on difference of real and

<u><math>Z\text{-Real} * Z\text{-Real} / Z\text{-Imag} * Z\text{-Imag}</math></u>	Mapping based on real part of Z squared divided by imaginary part of Z squared.
<u><math>Z\text{-Imag} * Z\text{-Imag} / Z\text{-Real} * Z\text{-Real}</math></u>	Mapping based on imaginary part of Z squared divided by real part of Z squared.
<u><math>(Z\text{-Real} * Z\text{-Real} + Z\text{-Imag} * Z\text{-Imag}) / Z\text{-Real} * Z\text{-Real}</math></u>	Mapping based on absolute value of of Z divided by real part of Z squared.
<u><math>(Z\text{-Real} * Z\text{-Real} - Z\text{-Imag} * Z\text{-Imag}) / Z\text{-Imag} * Z\text{-Imag}</math></u>	Mapping based on the difference of Z parts squared divided by the imaginary part of Z squared.
<u><math>Abs(Z\text{-Real}) * Abs(Z\text{-Imag})</math></u>	Mapping based on product of absolute value of parts of Z.
<u><math>&gt;Abs(Z\text{-Real})</math> or <math>Abs(Z\text{-Imag})</math></u>	Mapping based on highest absolute value of parts of z.
<u><math>&lt;Abs(Z\text{-Real})</math> or <math>Abs(Z\text{-Imag})</math></u>	Mapping based on lowest absolute value of parts of z.
<u><math>Abs(Z)</math></u>	Mapping based on absolute value of z.

Mapping supplies the bailout criteria for the iterative loops, both 3-D and 2-D fractal types.

## 7.1 Z-Real-Z-Imag

### **Z-Real-Z-Imag**

Mapping based on difference of real and imaginary parts of Z.

## 7.2 Z-Real\*Z-Real/Z-Imag\*Z-Imag

### **Z-Real\*Z-Real/Z-Imag\*Z-Imag**

Mapping based on real part of Z squared divided by imaginary part of Z squared.

## 7.3 Z-Imag\*Z-Imag/Z-Real\*Z-Real

### **Z-Imag\*Z-Imag/Z-Real\*Z-Real**

Mapping based on imaginary part of Z squared divided by real part of Z squared.

## 7.4 (Z-Real\*Z-Real+Z-Imag\*Z-Imag)/Z-Real\*Z-Real

### **(Z-Real\*Z-Real+Z-Imag\*Z-Imag)/Z-Real\*Z-Real**

Mapping based on absolute value of of Z divided by real part of Z squared.

## 7.5 (Z-Real\*Z-Real-Z-Imag\*Z-Imag)/Z-Imag\*Z-Imag

### **(Z-Real\*Z-Real-Z-Imag\*Z-Imag)/Z-Imag\*Z-Imag**

Mapping based on the difference of Z parts squared divided by the imaginary part of Z squared. Changes the way banding appears in complex mappings.

## 7.6 Abs(Z-Real)\*Abs(Z-Imag)

### **Abs(Z-Real) \* Abs(Z-Imag)**

Mapping based on product of absolute value of parts of Z. Changes the way banding appears

in complex mappings.

## 7.7 >Abs(Z-Real) or Abs(Z-Imag)

### >Abs(Z-Real) or Abs(Z-Imag)

Map based on the greater of the absolute value of the real part or the imaginary part of the complex number  $Z$ . Works like a logical 'or', where either part of  $z$  must exceed  $zlimit$  to break the iteration loop. Changes the way banding appears in complex mappings.

## 7.8 <Abs(Z-Real) or Abs(Z-Imag)

### <Abs(Z-Real) or Abs(Z-Imag)

Map based on the lesser of the absolute value of the real part or the imaginary part of the complex number  $Z$ . Works like a logical 'and', where both parts of  $z$  must exceed  $zlimit$  to break the iteration loop. Changes the way banding appears in complex mappings.

## 7.9 Abs(Z)

### Abs(Z)

Map based on the absolute value of the complex number  $Z$  (traditionally calculated by taking the square root of the sum of the squares of the real and imaginary parts of  $Z$ , but Orca uses only the 'sum'(modulus of  $z$ ) for break-point tests.) The standard method of mapping Julia and Mandelbrot sets.

# 8 Render Menu

## Render menu commands

The Render menu offers the following commands:

<a href="#">Orbit Trap Options</a>	Set orbit trapping method.
<a href="#">Use Pic as Trap Color</a>	Use image in clipboard for orbit-trap coloring.
<a href="#">Process Bailout</a>	Process bailout from orbit-trap, bubble or biomorphic option.
<a href="#">Divide By One Palette</a>	No split palette.
<a href="#">Divide By Two Palette</a>	Split palette into two sections.
<a href="#">Divide By Four Palette</a>	Split palette into four sections.
<a href="#">Divide By Eight Palette</a>	Split palette into eight sections.
<a href="#">Divide By Sixteen Palette</a>	Split palette into sixteen sections.
<a href="#">Divide By Thirty-Two Palette</a>	Split palette into thirty-two sections.
<a href="#">Texture Scale</a>	Set scaling factor for 3-D texture.
<a href="#">Add Noise</a>	Add noise to coloring.
<a href="#">Factors</a>	Edit noise factors.
<a href="#">Reset Noise Seed</a>	Re-seed random noise generator.
<a href="#">Filter</a>	Choose an optional tail-end filter.

## 8.1 Coloring Options

### Coloring Options

The following options are described as 2-D coloring options, but the Level Curve, Biomorphic and Decomposition options are also used for 3-D renderings.

### Inside Coloring Options

#### Level Curves

Level-curves map the set points based on the value of  $Z$ . This allows the inside of the complex set to be color-scaled.

#### Log Map

produces colored bands on the inside of the complex set. Points are mapped according to what the value of  $z$  is at final iteration.

Log Map

#### Small Log

produces circular patterns inside the complex set. Points are mapped according to the smallest value  $z$  gets during iteration.

Small Log

#### Atan Coloring

Uses an algorithm by David Makin to color an image. The angle of each point (as it escapes the set border) is used to color the image.

#### Bof60 Coloring

A variation of the Bof60 algorithm found in the classic Pietgen/Richter text, *The Beauty of Fractals*, adapted by David Makin, is used to color an image. The smallest magnitude of  $z$  (found while calculating the set border) is used to render the image.

**Linear Map** is mapped like Log Map (with the mapped value of the function at its final

iteration applied to the color palette) and produces 3D-like effects with orbit-trap renderings.

## Outside Coloring Options

### Iteration

The Iteration option uses the point's escape time.

Escape-time coloring.

### Log Palette

A point is colored based on its logarithmic escape. The QFactor controls the smoothness of the coloring. A small number from 10-20 works best here..

Log coloring.

### Continuous Potential

A point is colored based on its continuous potential (when it blows up.) The QFactor controls the smoothness of the coloring. A higher number from 2000-20000 works best here.

Continuous-Potential coloring.

Angle uses the absolute value of a point's exit angle (theta.) This is the atan method in Fractint. Angle-Iteration uses the angle formed by the difference between a point's last two exit values and subtracts the point's escape time. This is Paul Carlson's atan method.

### Set Only

The Set Only flag plots all outside points in the background color.

### 8.1.1 Log Map

**Log Map** produces colored bands on the inside of the complex set. Points are mapped according to what the value of  $z$  is at final iteration.

### 8.1.2 Small Log

**Small Log** produces circular patterns inside the complex set. Points are mapped according to the smallest value  $z$  gets during iteration.

### 8.1.3 Indexed Log

**Indexed Log** is mapped according to the escape time it takes  $z$  to reach its smallest value.

### 8.1.4 Linear Map

**Linear Map** is mapped like Log Map (with the mapped value of the function at its final iteration applied to the color palette) and produces 3D-like effects with orbit-trap renderings.

### 8.1.5 Indexed Linear

**Indexed Log** is mapped according to the escape time it takes  $z$  to reach its smallest value.

### 8.1.6 Bubble

Bubble uses Paul Carlson's contour-mapping method to produce 3D-like bubble pictures. The method is very sensitive to which formula is used, working best with the basic Mandelbrot set  $z^2+c$  and the like. The Scaling variable (Fractal Parameters window) needs to be a small negative value, usually less than one. A larger than necessary Scaling value will cause the colors to overlap in the bubbles. For split palette pictures, the colors are divided according to their level index, as in Indexed Linear. Note: the magnitude of the Scaling variable needs to be increased or decreased proportionately by the number of palette splits to keep the "bubbles" the same size. The color ranges in the palette should be graded from light to dark to highlight the bubble centers.

### 8.1.7 Use Level

**Use Level** -- All points (inside and outside) are colored according to the Level curve selected or Potential Linear if no level curve is selected.

### 8.1.8 Iteration

**Iteration** option uses the point's escape time to color points outside the Mandelbrot or Julia set.

### 8.1.9 Log Palette

**Log Palette** -- A point is colored based on its logarithmic escape. The QFactor controls the smoothness of the coloring. A small number from 10-20 works best here..

### 8.1.10 Continuous Potential

**Continuous Potential** -- A point is colored based on its continuous potential (when it blows up.) The QFactor controls the smoothness of the coloring. A higher number from 2000-20000 works best here.

### 8.1.11 Angle

**Angle** uses the absolute value of a point's exit angle (theta.) This is the atan method in Fractint.

### 8.1.12 Angle-Iteration

**Angle-Iteration** uses the angle formed by the difference between a point's last two exit values and subtracts the point's escape time. This is Paul Carlson's atan method.

### 8.1.13 QFactor

#### QFactor

The QFactor controls the smoothness of the coloring. A small number from 10-20 works best for Log Palettes, while higher number 2000-20000 is best for Continuous Potential.

### 8.1.14 Bubble Extensions

The **Bubble Extensions** button selects the Bubble map and Use Level coloring methods, and sets the Cutoff variable to a small negative value. It also selects a Divide-by-two palette if a split palette has not already been chosen. (The Palette may need to be redesigned in the Palette editor to match the split factor.) This automates the process of producing Paul Carlson's 3-D bubble-like fractals.

### 8.1.15 Biomorphic

#### Biomorphic

Biomorphs test the real Z and imaginary Z values after exiting the iteration loop. If the absolute value of either is less than the preset zlimit, the point is mapped as part of the set. This method produces biological-like structures in the complex plane. Normally the biomorph tendrils are colored in the set color (the color reserved for non-divergent or inner points.) With the Set Only flag on, the tendrils are colored according to the color-scaling option used (other external points are colored in the background color.)

### 8.1.16 Decomposition

#### Decomposition

When a Decomposition option is set, you have the option of performing either an external or internal binary decomposition. For Mandelbrot/Julia curves, z-arg is broken into two parts.

(Consult *The Beauty of Fractals* by Peitgen & Richter for a mathematical explanation of

decomposition.) When Biomorph or Epsilon is decomposed, the tendrils or hairs are decomposed as external points. Use the Set Only flag to emphasize the tendrils and hairs when external decomposition is used.)

### 8.1.17 Set Only

**Set Only** plots all outside points in the background color.

## 8.2 Orbit Trap Options

### Orbit Trap Options

This includes methods that trap the orbit of a point if it comes in range of a pre-specified area or areas.

Enter a value for Epsilon and Epsilon2, which are used to define the size of the orbit trap areas (.001-2.0 and 0.0-epsilon.) The exclude box is used to exclude the first # iterations (0-99) from orbit trapping.

Click on Apply to apply changes without closing the window. Click on Okay to close the window and apply changes, if any. Click on Cancel to exit the window without changing parameters.

Epsilon2 is used to create windows into the stalks. The default value is 0.0, which produces solid stalks. Epsilon2 has no effect on the Petal method.

## 8.3 Use Pic as Trap Color

### Use Pic as Trap Color

This option allows you to use a separate bitmap or picture to color the areas hit by the orbit trap. Enabled when a bitmap has been copied to the clipboard, each pixel inside the trap zone is replaced with its corresponding color in the clipboard image. This produces various mirror-like effects with different orbit traps. Notes: When you first enable this option, whatever is in the clipboard gets copied to a buffer file for use as the picture trap. To change the picture in the buffer, you need to disable this option, and then re-enable it. The clipboard image isn't saved with the data file, so you need to remember which bitmap file is used for the "pic trap", to redo a fractal like this later. For larger file sizes it helps to use higher-resolution clipboard images to reduce graininess in the target image. It also helps to move details around in the clipboard image, as the orbit traps tend to make non-symmetrical use of the pic-trap image.

## 8.4 Process Bailout

### Process Bailout command

For 3-D Julia fractals, the figure shape is defined by the dynamics of the orbit-trap, biomorphic or bubble method used. This has no affect on the figure if none of these methods are used for rendering. With orbit-traps and bubble fractals, this has the effect of blanking out all portions of the image that are not "trapped" or bubbles. With different mapping, the bubble and biomorphic options can add extra details (like stalks) outside of the actual 3-D figure, when the Set Only flag is not selected, instead of a plain background.

## **8.5 Divide by One Palette command**

### **Divide by One Palette**

Palette is not split before applying to pixel.

## **8.6 Divide by 2 Palette command**

### **Divide by Two Palette**

Palette is split into two parts before applying to pixel.

## **8.7 Divide by 4 Palette command**

### **Divide by Four Palette**

Palette is split into four parts before applying to pixel.

## **8.8 Divide by 8 Palette command**

### **Divide by Eight Palette**

Palette is split into eight parts before applying to pixel.

## **8.9 Divide by 16 Palette command**

### **Divide by Sixteen Palette**

Palette is split into sixteen parts before applying to pixel.

## **8.10 Divide by 32 Palette command**

### **Divide by Thirty-Two Palette**

Palette is split into thirty-two parts before applying to pixel.

## 8.11 Texture Scale command

### Texture Scale

Opens a window to edit the 3-D texture scale factor. The higher the scale factor, the more repetitive the texture becomes. Click on Apply to apply changes without closing the window. Click on Okay to close the window and apply changes. Click on Cancel to close the window without applying changes.

## 8.12 Add Noise command

### Add Noise (Render menu)

Add noise to image texture. A variation of Perlin's noise algorithm is used to add randomness to an image's coloring. Can be used with both 2-D and 3-D maps.

## 8.13 Factors command

### Factors (Render menu)

Edit noise factors. The Blend variable determines how much noise is added to an image. The higher the blend, the more pronounced the noise appears. This also tends to darken an image, which can be compensated for by decreasing Gamma. The Grain variable determines the frequency of the noise. The higher the grain, the noisier the image appears. You can adjust how the noise maps to an image by changing the scale factors. Higher scale factors make the image noisier on the respective axis (x, y and z.) Additional variables affect the type and shaping of the noise data: Gaussian is an alternate form of noise, while Planet, Check, Tooth, Barber and Wood apply a specific envelope to the noise. The Marble variable is used to introduce a low frequency or high frequency modulation on top of the noise. You can achieve marble-like textures by combining a high frequency marble value with a low frequency Blend value. The marble variable also adds a high-frequency bump map to the wood envelope.

The Surface Warp variable allows you to apply the same noise to a 3-D Julia figure's shape also, like a surface filter. Small values are best for creating realistic surface variations, like stone and wood grain.

## 8.14 Reset Noise Seed

### Reset Noise Seed (Render menu)

The random noise generator is re-seeded. Use this to create variations on the noise texture.

## 8.15 Filter command

### Filter (Render menu)

Based on Stephen C. Ferguson's filter algorithms in his program Iterations, this option allows you to choose one of 26 tail-end filters for surface rendering. Corresponds roughly to its effect on the basic Mandelbrot-squared set. The effect will vary with the formula and fractal

type chosen.

The Magnify variable is used to intensify or de-intensify the effect of the filter. This value can range from 1-500 nominally. Click on Apply to apply a new filter without closing the window. Click on Okay to close the window and apply changes. Click on Cancel to close the window without applying changes.

## 9 Pixel Menu

### Pixel menu commands

The Pixel menu offers the following commands:

<a href="#"><u>Phoenix</u></a>	Phoenix orientation.
<a href="#"><u>Invert</u></a>	Invert image around circle.
<a href="#"><u>Invert Off</u></a>	Reset inversion flag.
<a href="#"><u>Torus</u></a>	Use torus method.
<a href="#"><u>Torus Off</u></a>	Reset torus flag.
<a href="#"><u>Symmetry-&gt;</u></a>	Horizontal, vertical or XY symmetry.
<a href="#"><u>Switch Z For C</u></a>	Switch z for c.
<a href="#"><u>Solid-Guessing</u></a>	Solid-guessing plotting mode.

### 9.1 Phoenix option

#### Phoenix option (Pixel menu)

The Phoenix flag rotates the planes, so that the imaginary plane is mapped horizontally and the real plane is mapped vertically.

### 9.2 Invert command

#### Invert (Pixel menu)

The Invert flag inverts the plane around a circle. A window is opened that allows the user to specify the circle's radius and center coordinates. Select Auto Coords to let Orca calculate the center coordinates and circle radius. Using Auto Coords, the new radius and center coordinates are calculated when the picture is next drawn. You can zoom on an inverted picture as long as radius and center coordinates remain the same. Use the Perspective box to alter the X/Y symmetry of the inversion. A smaller Perspective value (less than 1.0) stretches the inversion in the vertical direction.

Original picture

Inverted

### 9.3 Invert Off command

#### Invert Off (Pixel menu)

Turns off the inversion flag. Alternatively you can set the inversion radius to 0.0 to turn off inversion.

### 9.4 Torus command

#### Torus Command

Pixels are mapped around a torus, and then expanded to fit the drawing area. A generalized form of Earl Hinrichs' torus method, variables are provided for center x and center y to define the c and z radii and may both equal 0.0. Results will vary with the formula used, but resembles the warping effect found in hypercomplex images. Two versions of this method are provided: the Pixel method which uses pixel values to map the torus to the fractal space, and the Two-Pi method which uses an initial rectangle  $2\pi$  by  $2\pi$  to map the torus to a fractal image. With the Two-Pi method, when you zoom the rectangle's size and starting points are changed to match the zooming area. The rectangle's coordinates are saved with the fractal. If you turn off the torus flag after zooming and then reinitialize the torus flag, the rectangle reverts to a  $2 \times 2$  area, so the image will change accordingly. Rotating is not supported for the Two-Pi method, but does work in a limited way with the Pixel method.

### 9.5 Torus Off

#### Torus Off

Turns off the torus flag. Alternatively you can enter a negative value to turn off this flag.

## 9.6 Symmetry ->

### Symmetry (Pixel menu)

This produces a mirror image from left to right (vertical) or top to bottom (horizontal) or both (xy). You can zoom with symmetry, but the results will be uncertain if the zoom box is off-center on the window.

Vertical symmetry

Horizontal symmetry

XY symmetry

## 9.7 Switch command

### Switch Z For C

When a Switch flag is set, you have switch Z for C. When Z is switched for C, normally you get Mandelbrots from Julia sets and vice versa.

## 9.8 Solid Guessing

### Solid Guessing (Pixel menu)

In the solid-guessing plotting mode, the program guesses at colors that lie inside rectangular areas of the plot. It first computes all the perimeter pixels of a rectangle, and checks if all the pixels have the same color. If so, all the pixels inside the rectangle are colored the same and

no further calculations are done on that rectangle. Otherwise the rectangle is broken into four parts and the above procedure is repeated for each part. If any of the perimeter pixels are different at this point, all the remaining pixels in the smaller rectangle are computed. The screen is updated in groups of 16 lines.

Note: this mode is disabled if the drawing aspect is other than 4/3 or 1/1.

## 10 View Menu

### View menu commands

The View menu offers the following commands:

[Toolbar](#) Shows or hides the toolbar.  
[Status Bar](#) Shows or hides the status bar.

### 10.1 Toolbar command

#### Toolbar command (View menu)

Use this command to display and hide the Toolbar, which includes buttons for some of the most common commands in Orca, such as File Open. A check mark appears next to the menu item when the Toolbar is displayed.

See [Toolbar](#) for help on using the toolbar.

#### 10.1.1 toolbar

##### Toolbar

The toolbar is displayed across the top of the application window, below the menu bar. The toolbar provides quick mouse access to many tools used in Orca,

To hide or display the Toolbar, choose Toolbar from the View menu (ALT, V, T).

**To**

Open the Orca Remote which contains shortcut buttons for many common tasks and options in Orca

Use Pilot to rotate figure, zoom and alter key cubic variables.

Open a new drawing, based on the default template.

Open an existing drawing. Orca displays the Open dialog box, in which you can locate and open the desired file.

Save the active drawing or template with a new name. Orca displays the Save As

	dialog box.
	Set image size.
	Edit formula/type data.
	Edit fractal parameters.
	Edit ray-tracing variables.
	Edit palette.
	Draw image from current parameters.
	Continue drawing.
	Zoom into rectangle.
	Show picture full-screen.
	Reset coordinates.
	Draw Mandelbrot set
	Draw Julia set
	Display info about Orca.
	Display Orca's help index.

## 10.2 Status Bar Command

### Status Bar command (View menu)

Use this command to display and hide the Status Bar, which describes the action to be executed by the selected menu item or depressed toolbar button, and keyboard latch state. A check mark appears next to the menu item when the Status Bar is displayed.

See [Status Bar](#) for help on using the status bar.

### 10.2.1 status bar

#### Status Bar

The status bar is displayed at the bottom of the Orca window. To display or hide the status bar, use the Status Bar command in the View menu.

The left area of the status bar describes actions of menu items as you use the arrow keys to navigate through menus. This area similarly shows messages that describe the actions of toolbar buttons as you depress them, before releasing them. If after viewing the description of the toolbar button command you wish not to execute the command, then release the mouse button while the pointer is off the toolbar button.

The right areas of the status bar indicate which of the following keys are latched down:

Indicator	Description
CAP	The Caps Lock key is latched down.
NUM	The Num Lock key is latched down.

SCRL          The Scroll Lock key is latched down.

## 11 Window Menu

### Window menu commands

The Window menu offers the following commands, which enable you to arrange multiple images in the application window:

<a href="#">Cascade</a>	Arranges windows in an overlapped fashion.
<a href="#">Tile</a>	Arranges windows in non-overlapped tiles.
<a href="#">Arrange Icons</a>	Arranges icons of closed windows.
<a href="#">Size Desktop</a>	Size drawing area to window frame.
<a href="#">Window 1, 2, ...</a>	Goes to specified window.

### 11.1 Cascade command

#### Cascade command (Window menu)

Use this command to arrange multiple opened windows in an overlapped fashion.

### 11.2 Tile command

#### Tile command (Window menu)

Use this command to arrange multiple opened windows in a non-overlapped fashion.

### 11.3 Arrange Icons command

#### Window Arrange Icons Command

Use this command to arrange the icons for minimized windows at the bottom of the main window. If there is an open drawing window at the bottom of the main window, then some or all of the icons may not be visible because they will be underneath this drawing window.

### 11.4 Size Desktop command

#### Window Size DeskTop Command

Use this command to size the active drawing window to its frame size. Use after Tile command to reduce white space around a drawing that is smaller than screen size.

## 11.5 1, 2, ... command

### 1, 2, ... command (Window menu)

Orca displays a list of currently open drawing windows at the bottom of the Window menu. A check mark appears in front of the drawing name of the active window. Choose a drawing from this list to make its window active.

## 12 Video Menu

### Video menu commands

The Audio/Video menu offers the following commands:

<a href="#">Write Avi Video</a>	Write video buffer to file.
<a href="#">Add Key Frame</a>	Add image to video buffer.
<a href="#">Reset Frames</a>	Reset frame buffer.
<a href="#">Edit Frames</a>	Edit frames in frame buffer.
<a href="#">Load Frames [OCV]</a>	Load frame buffer.
<a href="#">Save Frames [OCV]</a>	Save frame buffer.
<a href="#">View AVI</a>	View an AVI animation file.

### 12.1 Write Avi Video

#### Write Avi Video

Through a series of windows, this allows you to name and open an avi animation stream and choose a compression method. After using the file requester to name the file, you are given a choice of compression methods. The compression methods include Intel Indeo Video®, Microsoft Video 1 and Cinepak Codec by Radius. (All compression methods degrade the original images, some more than others.) The frames defined by the frame buffer are then plotted and written to the avi stream and the stream closed. Variables between each key frame are interpolated and frames added to the avi file to give the illusion of animation.

### 12.2 Add Key Frame

#### Add Key Frame

Orca uses a frame buffer to compose an animation. You add key frames to the buffer with this command. Each key frame is identical to the active image. Change variables between key frames to create the illusion of motion or morphing. You can edit the frames with the [frame editor](#).

## 12.3 Reset Frames

### Reset Frames

Delete the current frame buffer. The number of video frames is reset to zero.

## 12.4 Edit Frames

### Edit Frames

When the frame editor window is open you can edit the frames in the video buffer by using any of the other editor windows. The Move button allows you to move a frame from one spot in the buffer to another. You can change the frame image being edited by using the Frame slider or Edit box. After changing frames, use the Preview button to display the current frame being edited. The Delete button allows you to delete all but two of the frames, the minimum number of frames to create a movie. (If you want to delete all the frames, use the [Video/Reset Frames](#) command.) The Spread variable determines how many frames are generated between key frames. A higher value produces a smoother video, but also adds to the file size.

## 12.5 Save Frames [OCV]

This command saves the current frame buffer in a [ocv] file. A file requester is opened that allows you to choose the location and name of the frame library. The frame buffer files can also be used as image libraries, similar to Fractint's par and frm formats. The frames contain all the information to reproduce an image at any supported size.

## 12.6 Load Frames [OCV]

Load a frame buffer that has been previously saved by Orca. The buffer replaces any existing frame buffer.

## 12.7 View Avi command

### View Avi... (Video menu)

Opens an avi file for viewing. You can preview any multimedia file by clicking on its file name. A multimedia box will appear to the right of the file list. Click on okay to open the main view window.

There are buttons to Play a file forwards or Backwards, or forward automatically with Auto rewind/repeat. Click on Slow to slow down a video. Each click on Slow halves the viewing speed. A click on Stop freezes viewing and restores the view speed to normal playback.

Use the Open button to view a different avi file. Use the Save button to save the file in a different compression format. You must use a different name to save the file than the name that was used to open it. Click on the left-mouse button or any key to abort a save operation.

Note: the view avi requester can be used to preview any multimedia file, including midi files.

## 12.8 Avi Composite option

### AVI Composite (Video menu)

When this flag is set, Orca generates composite frames for a video according to the settings in the Image/Composite window. Each frame may then consist of a merging of up to 4 figures (1-4). You must set this flag and the composite options before beginning a video. After an avi stream has been opened, you can then use variations of any figure in the composite to produce tweens while using the Write Frames option. As usual, you vary data in the figure(s) before writing frames.

## 13 Demo Menu

### Demo menu commands

The Demo menu offers the following commands, which illustrate various features of Orca:

<a href="#">Random 2-D Julia</a>	Generate random 2-D Julia set fractal.
<a href="#">Random Stalks</a>	Generate random orbit-trap Julia set fractal.
<a href="#">Random Bubbles</a>	Generate random bubble Julia set fractal
<a href="#">Random 3-D Julia</a>	Generate random 3-D Julia set fractal.
<a href="#">Random Render</a>	Apply random coloring.
<a href="#">Batch Mode/Random Setup</a>	Set up initial values for batch mode/random commands.

### 13.1 Random 2-D Julia

#### Random 2-D Julia (Demo menu)

A random Julia fractal is generated. Many of the built-in options of Orca are selected on a random basis (if enabled in the Random Setup window), and the Mandelbrot space for one of the twenty-two built-in formulas is scanned for an interesting Julia set. The palette used is also randomized (if Random coloring is selected.). Note: In most cases the Julia search is a short one, but sometimes the "seek" mode can seem to get stuck when the criteria for an interesting Julia set fails to match the formula used. In the latter case, click the left mouse button to restart the search process. Tip: some things remain to be done after the Julia set is drawn. Feel free to experiment with all the parameters, reframe the image, change palettes etc. This routine provides a fast intro to many options in Orca that the user may be unfamiliar with: no knowledge of fractal science/math required! See the [hot keys](#) section also for a description of the 'F' command.

### 13.2 Random Stalks

#### Random Stalks (Demo menu)

A random Julia fractal is generated using one of Paul Carlson's orbit trap methods.

### 13.3 Random Bubbles

#### Random Bubbles (Demo menu)

A random Julia fractal is generated using Paul Carlson's bubble method.

### 13.4 Random 3-D Julia command

#### Random 3-D Julia (Demo menu)

A random quaternion/hypernion fractal is generated. A set of formulas appropriate for 3-D fractals is scanned to find an interesting Julia set, and then the parameters are adjusted to produce a quaternion or hypernion image. The ranges are reset (if z-space is unselected in the Random Setup window), Z is set to 2.0, and the lighting is set for optimum viewing (if lighting is checked in the [Random Batch](#) window.)

Note: for some images a Z value of 2.0 may result in a partially clipped image. Sometimes it helps to increase this value to 2.5 or 3.0, but too high a value may interfere with solid guessing.

See the [hot keys](#) section also for a description of the 'G' command.

### 13.5 Random Render command

#### Random Render (Demo menu)

A random coloring filter is applied. This changes the surface textures of the 3-D figure.

### 13.6 Batch Mode / Random Setup

#### Batch mode/Random Setup (Demo menu)

Here you set parameters for batching and saving random-generated images to disk. You can also customize random variables to direct how the random scanning process works. When the Repetitions value is non-zero, up to 1000 random images can be generated and saved to disk. Use a unique Filename to prevent batch files from overwriting existing image files. You can also change the default directory for batch files, by clicking on the "..." button next to the default directory box. The Scan Limit directs the program on how many scans it makes through each formula before it skips to a new formula (if an interesting fractal space hasn't been found.)

There are radio boxes that allow you to customize how random variables are processed to create new fractals:

- Formula -- (default on) check to randomize built-in formula used
- Lighting -- (default off) check to set default lighting
- Symmetry -- (default off) check to randomize symmetry used

Rotation -- (default on) check to randomize camera angles  
 Coloring -- (default off) check to reset coloring parameters  
 Iteration -- (default off) check to randomize iterations  
 Z-Space -- (default on) check to set default z-space  
 Constants -- (default on) check to randomize the complex constants  $c_j$  and  $c_k$   
 Slices -- (default off) check to randomize slice in Initial Values window  
 Stalks -- (default off) check to randomize orbit-trap  
 Level -- (default off) check to randomize level curve  
 Filter -- (default off) check to randomize filter  
 Fn1/Fn2 -- (default off) check to randomize user-defined functions  
 Types -- (default on) check to randomize quad math used  
 Mapping (default off) check to randomize bailout mapping

The Bounds variable (default 0) acts to delimit the boundary scan after finding a random Julia set. Since the scanning process is closely connected with the Mandelbrot set boundaries, most 3-D fractals found this way are very connected/closed figures. The bounds variable adds a random distance from the Mandelbrot boundary to produce more open fractals. A good value to start with is 25 if you want to experiment with this option.

## 14 Help Menu

### Help menu commands

The Help menu offers the following commands, which provide you assistance with this application:

<a href="#">Getting Started</a>	Tutorial for new users of Orca.
<a href="#">Index</a>	Offers you an index to topics on which you can get help.
<a href="#">Hot Keys</a>	Quick reference to Orca's hot keys.
<a href="#">Parser Info</a>	Quick reference to Orca's parser variables and functions.
<a href="#">Built-in Formulas</a>	Quick reference to Orca's built-in formulas.
<a href="#">Bibliography</a>	Sources for fractal information and complex numbers.
<a href="#">About Orca</a>	Displays the version number and author info for this application.

### 14.1 Getting Started

#### Getting Started

Welcome to Orca!

This is a short tutorial that will cover basic commands and background material necessary for a new user to create an initial picture with Orca. For help on any menu command, press F1 while the command is highlighted. For help with a dialog window, click on the Help button inside that window.

Start by resetting all Figures, using the Image/Reset All menu option. The drawing window is erased and a quaternion map of the Mandelbrot set is drawn. The 2-D Mandelbrot set is frequently considered a map of all Julia sets. Here we are just interested in what 3-D Julia sets can be generated using the 3-D Mandelbrot as a rough map. Use the [hot key combo shift-G](#) to turn on 3-D exploratory mode. The cursor changes and you can click on any portion of the draw window. If you left-click inside the draw window, the right-hand corner (in this case called sector 2) will be erased, and a miniature version of the Julia set that uses that space as its constants will be drawn. You can continue to click on areas of the draw window and see what Julia set lies there, or you can press the space bar to open a new window and draw the quaternion full-size. Press 'Esc' to exit this mode without creating a new window.

Once you've found and drawn a Julia set that looks good, you can change its palette or surface pattern. Use the palette editor to create a custom palette, or even create a random palette using the Random button.

For a good preview of what Orca is capable of, be sure to experiment with all the Demo/Random commands.

You'll probably be doing a lot of zooming and framing on your plots later, so we'll cover that briefly here. After the fractal is finished plotting (or as much of it is finished that you want to zoom in on), select the [Zoom](#) command off the Image menu, or just point and click the left-mouse button over any area of the drawing. A box a quarter the size of the window will appear that you can move around with the mouse. Hold the left-mouse button down to shrink the box, or the right-mouse button down to expand the box. Move the box over the area you are zooming in on, size the box if necessary and when it includes the details you want, press the space bar. The plot will be redrawn at zoom scale. To zoom out, you can use the Shift key to expand the zoom box X 4. To exit this mode without zooming, click on the title bar of the draw window or press 'Esc'. Most of the time you'll be zooming in to reframe a fractal, or zooming out to include parts of the fractal that may appear outside the default z-space.

Special note: As you explore the many options included in Orca you'll find that many of the

variable windows are non-modal, so they can stay open while the fractal is being plotted. This allows you to change some coloring and lighting variables without redrawing the fractal, or repeatedly experiment with other aspects of the fractal-design process. All of the non-modal windows have an Apply button for applying changes directly without closing the window, or an Okay button for applying changes and closing the window. To close the window without making any further changes, click on the window's close button. The Cancel button, if present, allows you to revert to when the window was last opened. Some commands external to the window may cause it to close and reopen if variables were changed externally. In this case Cancel "goes back" to after the window was reopened.

Orca allows you to [Undo](#) the last command in most cases. However this is mostly a failsafe command, as it requires you to redraw the fractal to change colors or lighting variables.

This completes the Getting Started tutorial. Be sure to read the [hot keys](#) and [built-in formulas](#) sections for additional info. The [Bibliography](#) lists additional reference material for a better understanding of the fractal types and functions contained in Orca.

## 14.2 Index command

### Index command (Help menu)

Use this command to display the opening screen of Help. From the opening screen, you can jump to step-by-step instructions for using Orca and various types of reference information.

Once you open Help, you can click the Contents button whenever you want to return to the opening screen.

## 14.3 Hot Keys

### Hot keys

Shift-P --- grab point from Mandelbrot set(real and imaginary parts) and put values in complex constant. Cursor changes to a cross-hatch, which you position over the area of the Mandelbrot set of interest. Then click the left-mouse button to transfer the pixel's coordinates to the c constant. Click outside window or in window frame to exit routine without "grabbing" a point.

Shift-J -- like "P", except that a Julia set is drawn immediately in sector 2 at size 100 and with iterations of 100. This is a fast exploratory routine for finding interesting Julia sets that can also be used where the Mandelbrot set is discontinuous as in the Phoenix formula. Unlike the "P" command, "grabbing,"(and drawing) continues until you click on the window's frame.

Note: when you exit the J command, once you find an interesting Julia set; another window is opened with the Julia type set. The parameters in the original window revert to their original Mandelbrot settings. Click on the escape key to exit this mode without generating a Julia set.

Shift-G -- A 3-D Julia set is generated in sector 2, using an iteration count of 10 and other parameters are changed temporarily to suit 3-D plots. (Z is set to 2.0, the rotational variables

are reset and the light source is set to the default, if random lighting is enabled.) Once you find an interesting quaternion set using "G" (by clicking in any area around the Mandelbrot borders or anywhere in the draw window), press the space bar and another window is opened that sets the fractal parameters to those in the exploratory window. The parameters in the exploratory window revert to their original settings. Click on the escape key to exit this mode without generating a Julia set.

Shift-U -- like "G" except that you choose the target type and beginning parameters. This is useful for exploring cubic Mandelbrot sets, insofar as you can scan the complex  $c$  planes for interesting variations. Also works for other multi-dimensional Mandelbrot formulas that are dependent on the  $c$  planes. Hint: turn off the Image/Auto-Redraw option after drawing the mapping picture. You can then set the target set (Mandelbrot, quaternion, etc.) before using this key sequence, without erasing the mapping picture.

Shift L: -- Like 'G' except this modifies the  $c_i$  and  $c_j$  elements of the complex constant to locate a quaternion Julia set.

Shift K: -- Like 'G' except this modifies the  $c_j$  and  $c_k$  elements of the complex constant to locate a quaternion Julia set.

Shift-F -- generate a Julia set from a formula's MandelbrotP space. Random points in a formula's current Mandelbrot space are scanned for an interesting Julia set.

Shift-Z -- zoom in/out coordinates. Like the menu command except does not immediately redraw the picture. This allows you to zoom into another screen sector without erasing the previous picture.

Shift-C -- clear the draw window to the current background color.

## 14.4 Parser Information

**Parser Information** (for optional Bail box)

**Functions** (capital letters are optional, and parenthesis are necessary around complex expressions)

The following information takes the form "standard function" --- "form used by Orca to represent standard function".

sine  $z$  ---  $\sin(z)$  or  $SIN(Z)$  ; where  $Z$  can be any quad expression or variable

hyperbolic sine  $z$  ---  $\sinh(z)$  or  $SINH(Z)$

arcsine  $z$  ---  $\text{asin}(z)$  or  $ASIN(Z)$

cosine  $z$  ---  $\cos(z)$  or  $COS(Z)$

hyperbolic cosine  $z$  ---  $\cosh(z)$  or  $COSH(Z)$

arccosine  $z$  ---  $\text{acos}(z)$  or  $ACOS(Z)$

tangent  $z$  ---  $\tan(z)$  or  $TAN(Z)$

hyperbolic tangent  $z$  ---  $\tanh(z)$  or  $\text{TANH}(Z)$   
 arctangent  $z$  ---  $\text{atan}(z_)$  or  $\text{ATAN}(Z)$   
 cotangent  $z$  ---  $\text{cotan}(z)$  or  $\text{COTAN}(Z)$   
 arccotangent  $z$  ---  $\text{acotan}(z)$  or  $\text{ACOTAN}(Z)$   
 $e^z$  ---  $\text{exp}(z)$  or  $\text{EXP}(z)$  -- the exponential function  
 natural log of  $z$  ---  $\log(z)$  or  $\text{LOG}(Z)$   
 absolute value of  $z$  ---  $\text{abs}(z)$  or  $\text{ABS}(Z)$   
 square root of  $z$  ---  $\text{sqrt}(z)$  or  $\text{SQRT}(Z)$   
 $z$  squared ---  $\text{sqr}(z)$  or  $\text{SQR}(Z)$   
 real part of  $z$  ---  $\text{real}(z)$  or  $\text{REAL}(Z)$   
 imaginary part of  $z$  ---  $\text{imag}(z)$  or  $\text{IMAG}(Z)$   
 'j' or third component of  $z$  ---  $\text{imaj}(z)$  or  $\text{IMAJ}(Z)$   
 'k' or fourth component of  $z$  ---  $\text{imak}(z)$  or  $\text{IMAK}(Z)$   
 convert  $z$ -real to  $zi$  --  $\text{gami}(z)$  or  $\text{GAMI}(Z)$   
 convert  $z$ -real to  $zj$  --  $\text{jami}(z)$  or  $\text{JAMI}(Z)$   
 convert  $z$ -real to  $zk$  --  $\text{kami}(z)$  or  $\text{KAMI}(Z)$   
 modulus of  $z$  ---  $\text{mod}(z)$  or  $\text{MOD}(Z)$  or  $|z|$  --  $(x*x + y*y)$   
 conjugate of  $z$  --  $\text{conj}(z)$  or  $\text{CONJ}(z)$  --  $(x-yi)$   
 $\text{flip}(z)$  ---  $\text{flip}(z)$  or  $\text{FLIP}(Z)$  -- exchange real and imaginary parts of  $z$  ( $y+xi$ )  
 polar angle of  $z$  --  $\text{theta}(z)$

### Math operators

+ --- addition  
 - --- subtraction  
 \* --- multiplication  
 / --- division  
 ^ --- power function  
 < --- less than  
 <= --- less than or equal to  
 > --- greater than  
 >= --- greater than or equal to  
 != --- not equal to  
 == --- equal to  
 || --- logical or (if  $\text{arg1}$  is  $\text{TRUE}(1)$  or  $\text{arg2}$  is  $\text{TRUE}$ )  
 && --- logical and (if  $\text{arg1}$  is  $\text{TRUE}$  and  $\text{arg2}$  is  $\text{TRUE}$ )

### Constants and variables

complex constant ---  $c$  or  $C$ , read/write.  
 complex conjugate ---  $cc$  or  $CC$ , read-only.  
 $e$  ---  $e$  or  $E$  --  $1e^1$  -- 2.71828, read/write.  
 $i$  ---  $i$  or  $I$  -- square root of  $-1$ , read-only. This is equivalent to the quad constant  $0+1i+0j+0k$ .  
 iteration ---  $\text{iter}$  -- iteration loop counter  
 $j$  ---  $j$  or  $J$  -- third component of quad constant, read-only. This is equivalent to the quad constant  $0+0i+1j+0k$ .  
 $k$  ---  $k$  or  $K$  -- fourth component of quad constant, read-only. This is equivalent to the quad

constant  $0+0i+0j+1k$ .  
 p --- p or P -- the real part of the complex constant, as entered in the cr box, read-only.  
 p1 -- the quad constant entered in the cr, ci, cj and ck boxes, read-only.  
 pi --- pi or PI -- 3.14159, read/write.  
 q --- q or Q -- the imaginary part of the complex constant, [ci box] evaluated as a real number, read-only.  
 x --- x or X -- real part of Z, read/write.  
 y --- y or Y -- coefficient of the imaginary part of Z, read/write.  
 z --- z or Z -- function value at any stage of the iteration process, read/write.  
 zn or ZN -- the value of z at the previous stage of iteration, read-only.

## 14.5 Built-in Formulas

**Built-in Formulas** (enter or select the following prefix in the [Function](#) dropdown box)

- A0  $fn1(z)*fn2(z)+c$  (Note 1)
- A1  $fn1(z)-cfn2(z)$
- A2  $fn1(z)+fn2(z)+c$
- A3  $cfn1(z)*fn2(z)+c$
- A4  $fn1(z)+cfn1(z)+1$  "
- A5  $fn1(fn2(z))+c$  "
- A6  $fn1(z)+fn2(c)$  "
- A7  $fn1(z)+fn2(zn)+c$  "
- A8  $cfn1(z)+fn2(zn)$  "
- A9  $fn1(z)+k*fn2(zn)+j$  "
- B0  $fn1(z)/fn2(z)+c$  "
- B1  $fn1(z)*(1/(fn2(z)+c))$  "
- B2  $(fn1(z)/fn2(z))^2+c$  "
- B3  $(fn1(z)/fn2(z))^3+c$  "
- B4  $fn1(z)/(1-fn2(z))+c$  "
- B5  $fn1(z)*fn2(z)-c$  (var) "
- B6  $fn1(z)/(fn2(z)+c)$  "
- B7  $cfn1(z)*(1-fn2(z))$  "
- B8  $if(abs(z)>S fn1(z) else fn2(z))+c$  (Note 2)
- B9  $fn1(z)*(1-c*fn2(z))+c$  "
- C0  $fn2(fn1(z)+c1)+c2$  (Note 3)
- C1  $fn1(z)-3*c1^2*fn2(z)+c2$  "

Note 1: fn1 and fn2 are functions selected from the fn1 and fn2 boxes in the [Formula Parameters](#) window:

- |              |             |              |             |
|--------------|-------------|--------------|-------------|
| 0: sin(w).   | 1: sinh(w). | 2: cos(w).   | 3: cosh(w). |
| 4: tan(w).   | 5: tanh(w). | 6: exp(w).   | 7: ln(w).   |
| 8: w^c       | 9: w^z.     | 10: 1/w.     | 11: w^2.    |
| 12: w^3.     | 13: abs(w). | 14: sqrt(w). | 15: w.      |
| 16: conj(w). | 17: csc(w). | 18: csch(w). | 19: sec(w). |
| 20: sech(w). | 21: cot(w). | 22: coth(w). | 23: cw.     |
| 24:          |             |              |             |

1.	25: arsin(w).	26: arcsinh(w).	27: arccos(w).	28:
	arccosh(w).			
	29: arctan(w).	30: arctanh(w).	31: arccot(w).	32:
	arccoth(w).			
	33: vers(w).	34: covers(w).	35: $L_3(w)$ : 3rd degree Laguerre	
	polynomial.			
	36: gamma(w): first order gamma function.		37: G(w): Gaussian probability function -	
	- (1/sqr(2pi))*e^(.5w^2).			
	38: $c^{(s+si)}$ .	39: zero.	40: $w^{(s+si)}$ .	41:
	$ (wx) + (wy) *i(abs)$ .			
	42: $wy+wx*i(flip)$ .	43: conj(cos(w))--cosxx.	44: theta(w) -- polar angle(w).	
	45: real(w).	46: imag(w)	47: w+c	48: $w^2-c$
	49: $w^3-c$	50: $\pi*w$	51: $e*w$	

Note 2: S is entered in the S box in the [Formula Parameters](#) window.

Note 3: Part of c2(real) and the rest of c2(c2i, c2j and c2k) are entered as the Complex constant in the [Fractal Parameters](#) window. C1 is defined as initial z (z-real and z-imag) and is handled independent of any user input.

## 14.7 About Orca

### About Orca

>>>>> Orca™ v3.057 © 2008 by Terry W. Gintz

Orca graphs 2-D and 3-D slices of formulas based on 4-D complex number planes. Orca currently supports quaternion, hypernion, [cquat](#) and [juliati](#) renderings of the Mandelbrot set and Julia sets. The complex math functions supported include  $\sin(z)$ ,  $\sinh(z)$ ,  $z^z$ ,  $e^z$ ,  $z^n$ ,  $\sqrt{z}$ ,  $\cos(z)$ ,  $\cosh(z)$ ,  $\tan(z)$ ,  $\tanh(z)$ ,  $\log(z)$ ,  $\ln(z)$ ,  $n^z$  and others. Random image generators, batch mode and integrated video routines make the program easy for beginners and a powerful complement to advanced fractal artists.

Hypercomplex extensions (as described in Fractal Creations) are standard for all the formulas.

Orca requires a true-color video adapter for best results. It works in 16-bit (high color) also.

Memory requirements for Orca vary with the size of the drawing area Orca opens on, ranging

from approximately 3 megabytes memory for a 640X480 area to 48 megabytes for a 2048X1536 area. Special routines have been added to reduce memory requirements for large bitmaps (up to 14400X10800) by writing these directly to a file instead of using a memory bitmap.

Acknowledgements: many thanks to Paul Carlson for his algorithms for 3D-like fractals. Special thanks to Frode Gill for his quaternion and ray-tracing algorithms, to Dirk Meyer for his Phong-shading algorithm, and to David Makin for sharing his ideas on quaternion colorings and 3-D insights. Thanks also to Francois Guibert for his Perlin noise example. The multi-windowing interface in Orca is courtesy of that extraordinary and prolific fractal programmer, Steven C. Ferguson.

For a short history of the programs preceding Orca, see [Chronology](#).

## 14.8 Chronology

### Chronology

History of this program:

In September 1989, I first had the idea for a fractal program that allowed plotting all complex functions and formulas while attending a course on College Algebra at Lane College in Eugene, Oregon. In November 1989, ZPlot 1.0 was done. This Amiga program supported up to 32 colors, 640X400 resolution, and included about 30 built-in formulas and a simple formula parser.

May 1990 -- ZPlot 1.3d -- added 3-D projections for all formulas in the form of height fields.

May 1991 -- ZPlot 2.0 -- first 236-color version of ZPlot for Windows 3.0.

May 1995 -- ZPlot 3.1 -- ZPlot for Windows 3.1 -- 60 built-in formulas. Added hypercomplex support for most built-in formulas.

May 1997 -- ZPlot 24.02 -- first true color version of ZPlot -- 91 built-in formulas. Included support for 3-D quaternion plots, Fractint par/frm files, Steve Ferguson's filters, anti-aliasing and Paul Carlson's orbit-trap routines.

June 1997 -- ZPlot 24.03 -- added Earl Hinrichs Torus method.

July 1997 -- ZPlot 24.08 -- added HSV filtering.

December 1997 -- Fractal Elite 1.14 -- 100 built-in formulas; added avi and midi support.

March 1998 -- Split Fractal Elite into two programs, Dreamer and Medusa(multimedia.)

April 1998 -- Dofu 1.0 -- supports new Ferguson/Gintz plug-in spec.

June 1998 -- Dofzo-Zon -- redesigned multi-window interface by Steve Ferguson, and includes Steve's 2-D coloring methods.

August 1998 --Dofzo-Zon Elite -- combination of Fractal Elite and Dofzo-Zon

October 1998 -- Dofzo-Zon Elite v1.07 -- added orbital fractals and IFS slide show.

November 1998 -- Dofzo-Zon Elite v1.08 -- added lsystems.

April 1999 -- Split Dofzo-Zon Elite into two programs: Fractal Zplot using built-in formulas and rendering methods, and Dofzo-Zon to support only plug-in formulas and rendering methods.

May 1999 -- Fractal Zplot 1.18 -- added Phong highlights, color-formula mapping and random fractal methods.

June 1999 -- completed Fractal ViZion -- first version with automatic selection of variables/options for all fractal types.

July 1999 -- Fractal Zplot 1.19 -- added cubic Mandelbrot support to quaternion option; first pc fractal program to render true 3-D Mandelbrots.

September 2000 -- Fractal Zplot 1.22 -- added support for full-screen AVI video, and extended quaternion design options

October 2000 -- QuaSZ(Quaternion System Z) 1.00 -- stand alone quaternion/hypernion/cubic Mandelbrot generator

November 2000 -- Added octonion fractals to QuaSZ 1.01.

March 2001 -- Cubics 1.0 -- my first totally-3-D fractal generator.

May 2001 -- QuaSZ 1.03 -- added Perlin noise and improved texture mapping so texture tracks with animations.

June 2001 -- Fractal Zplot 1.23 -- added Perlin noise and quat-trap method.

July 2001 -- QuaSZ 1.05 -- improved performance by converting many often-used dialogs to non-modal type.

November 2001 -- DynaMaSZ 1.0, the world's first Dynamic Matrix Systems fractal generator

January 2002 -- MiSZle 1.1 -- generalized fractal generator with matrix algebra extensions

May 2002 -- DynaMaSZ SE 1.04 (unreleased version)-- scientific edition of DMZ, includes support for user-variable matrix dimensions (3X3 to 12X12)

January 2003 -- PodME 1.0 -- first stand-alone 3-D loxodromic generator, Hydra 1.0 -- first 3-

D generator with user-defined quad types and Fractal Projector a Fractal ViZion-like version of DMZ SE limited to 3X3 matrices

May 2003 -- QuaSZ 3.052 -- added genetic-style function type and increased built-in formulas to 180. Other additions since July 2001: generalized coloring, support for external coloring and formula libraries, and Thomas Kroner's loxodromic functions.

May 2003 -- FraSZle and Fractal Zplot 3.052 -- added random 3-D orbital fractals, new 3-D export methods, upgraded most frequently-used dialogs to non-modal type and added genetic-style function type. FZ now based on FraSZle except for built-in formula list and Newton support.

July 2004 – Added the features of Hydra, Cubics and PodME to QuaSZ, now renamed "Quad Surface Zplot". Merged FraSZle with Fractal Zplot, and Fractal Projector with DynaMaSZ SE to form DynaMaSZ 2, including support for the original DynaMaSZ files.
